Abstract. For a two dimensional, weakly coupled system of fermions at temperature zero, one principal ingredient used to control the composition of the associated renormalization group maps is the careful counting of the number of quartets of sectors that are consistent with conservation of momentum. A similar counting argument is made to show that particle-particle ladders are irrelevant in the case of an asymmetric Fermi curve.

XVIII. Introduction to Part 4

In the application of the results of Parts 1 through 3 to many fermion systems ([FKTf1–f3]) the effective potential and all the quantities derived from it will conserve particle number. Particle number conservation implies that sectorized functions $\varphi((\cdot, s_1), \dots, (\cdot, s_n)) \in \mathcal{F}_0(n; \Sigma)$, where Σ is a sectorization, vanish unless the configuration $s_1, \dots, s_n$ of sectors is consistent with conservation of momentum (for a more precise statement see Definition XX.1 and Remark XX.2). We shall count the number of configurations $s_1, \dots, s_n$ of sectors consistent with conservation of momentum that satisfy certain constraints. The results are used to compare different norms for four point functions (Proposition XIX.1), and to compare norms associated to different sectorizations at different scales (Proposition XIX.4). The latter is crucial for a multi scale analysis of many fermion systems ([FKTf1–f3]). Notation tables are provided at the end of the paper.

We retain the assumptions that the dispersion relation $e(\mathbf{k})$ is $r + d + 1$ times differentiable, with $r \geq 2$ and $d = 2$, and that its gradient does not vanish on the Fermi curve $F = \{ \mathbf{k} \in \mathbb{R}^d \mid e(\mathbf{k}) = 0 \}$. All the above results hold under additional geometric assumptions on the geometry of the Fermi curve F . First of all, we assume throughout the rest of the paper that the Fermi curve F is **strictly convex**, with curvature bounded away from zero. If the dispersion relation $e(\mathbf{k})$ is that of a background electric field alone then $e(\mathbf{k}) = e(-\mathbf{k})$ and the Fermi curve F is symmetric about the origin. That is, $\mathbf{k} \in F$ if and only if $-\mathbf{k} \in F$.

Definition XVIII.1

i) Since F is strictly convex, for each point $\mathbf{k} \in F$ there is a unique point $a(\mathbf{k}) \in F$ different from $\mathbf{k}$ such that the tangent lines to F at $\mathbf{k}$ and $a(\mathbf{k})$ are parallel. $a(\mathbf{k})$ is called the antipode of $\mathbf{k}$.

ii) We say that F is symmetric about a point $\mathbf{p} \in \mathbb{R}^2$ if $F = \{ 2\mathbf{p} - \mathbf{k} \mid \mathbf{k} \in F \}$.

Example XVIII.2 If F is symmetric about a point $\mathbf{p}$ then $a(\mathbf{k}) = 2\mathbf{p} - \mathbf{k}$ for all $\mathbf{k} \in F$.

Symmetry of the Fermi curve about a point allows for the formation of Cooper pairs and the phase transition to a superconducting state. In [FKTf1–3] we show that this is the only instability in a broad class of short range many fermion models. We now make a precise asymmetry assumption on the geometry of the Fermi surface.

Definition XVIII.3 Choose an orientation for F .

i) Let $\mathbf{k} \in F$, $\vec{\tau}$ the oriented unit tangent vector to F at $\mathbf{k}$ and $\vec{n}$ the inward pointing unit normal vector to F at $\mathbf{k}$. Then there is a function $\varphi_{\mathbf{k}}(s)$, defined on a neighbourhood of 0 in $\mathbb{R}$, such that $s \mapsto \mathbf{k} + s\vec{\tau} + \varphi_{\mathbf{k}}(s)\vec{n}$ is an oriented parametrization of F near $\mathbf{k}$.

ii) We say that F is strongly asymmetric if there is $n_0 \in \mathbb{N}$, with $n_0 \leq r$, such that for each $\mathbf{k} \in F$ there exists an $n \leq n_0$ such that

$$\varphi_{\mathbf{k}}^{(n)}(0) \neq \varphi_{a(\mathbf{k})}^{(n)}(0)$$

Remark XVIII.4

i) By construction, $\varphi_{\mathbf{k}}(0) = \dot{\varphi}_{\mathbf{k}}(0) = 0$ and $\ddot{\varphi}_{\mathbf{k}}(0)$ is the curvature of F at $\mathbf{k}$.

ii) If F is symmetric under inversion in some point $\mathbf{p} \in \mathbb{R}^2$, then $\varphi_{\mathbf{k}} = \varphi_{a(\mathbf{k})}$ for all $\mathbf{k} \in F$.

iii) In [FKTa] we show that independent electrons in a suitably chosen periodic electromagnetic background field have a dispersion relation whose associated Fermi curve, for suitably chosen chemical potential, is smooth, strictly convex, strongly asymmetric and has nonzero curvature everywhere.

iv) In [FKTf1–3] we show that a many fermion system with a strongly asymmetric Fermi surface and weak, short range interaction is a Fermi liquid.

Throughout the rest of the paper we assume, unless otherwise stated, that the Fermi surface is strictly convex and either symmetric about a point or strictly asymmetric in the sense of Definition XVIII.3. In Section XXII, we derive a sector counting result that holds only for strongly asymmetric Fermi curves and use it to get an estimate on particle–particle bubbles that is better than the logarithmic divergence that, in the case of a symmetric Fermi surface, is responsible for the Cooper instability.

We emphasize that for the sector counting arguments of Section XX, the fact that the model is in two space dimensions is crucial. Propositions XX.10 and XX.11 would not hold in a three dimensional situation. See [FKTf1, §II, subsection 8].

XIX. Comparison of Norms

Theorem XV.3 indicates that ladders give the dominant contributions to $w_{0,4}$. The $|\cdot|_{3,\Sigma}$ norm of ladders will be estimated in §XXII and [FKT1]. To control the $N(w; \dots)$ norms of w , we develop a bound on the $|\cdot|_{1,\Sigma}$ norm of a ladder in terms of its $|\cdot|_{3,\Sigma}$ norm.

Proposition XIX.1 *Let Σ be a sectorization of length $\frac{1}{M^{2j/3}} \leq \mathfrak{l} \leq \frac{1}{M^{j/2}}$ at scale $j \geq 4$. Furthermore let $\varphi \in \mathcal{F}_0(4, \Sigma)$ and $f \in \tilde{\mathcal{F}}_{4;\Sigma}$ be particle number conserving functions. Then*

$$|\varphi|_{1,\Sigma} \leq \text{const} \frac{1}{\mathfrak{l}} |\varphi|_{3,\Sigma} \quad \text{and} \quad |f|_{1,\Sigma}^{\sim} \leq \text{const} \frac{1}{\mathfrak{l}} |f|_{3,\Sigma}^{\sim}$$

with a constant const that is independent of M, j, Σ

This Proposition is proven after Lemma XXI.1. In the renormalization group analysis, we go from scale to scale. After integrating out scale j , we shall have an effective potential $\mathcal{W}$ with a representative w , sectorized at scale j ; and we will have an estimate on the norm of w . To apply Theorem XV.3 at scale $j+1$ we then need a representative for $\mathcal{W}$ that is sectorized at scale $j+1$ and estimates on it. This change of sectorizations is implemented by

Definition XIX.2 Let $j, i \geq 2$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length $\mathfrak{l}'$ at scale i , respectively. If $i \neq j$, define, for functions φ on $\mathcal{B}^m \times (\mathcal{B} \times \Sigma')^n$ and f on $\check{\mathcal{B}}^m \times (\mathcal{B} \times \Sigma')^n$,

$$\begin{aligned} \varphi_{\Sigma}(\eta_1, \dots, \eta_m; (\xi_1, s_1), \dots, (\xi_n, s_n)) &= \sum_{s'_1, \dots, s'_n \in \Sigma'} \int d\xi'_1 \dots d\xi'_n \varphi(\eta_1, \dots, \eta_m; (\xi'_1, s'_1), \dots, (\xi'_n, s'_n)) \prod_{\ell=1}^n \hat{\chi}_{s_{\ell}}(\xi'_{\ell}, \xi_{\ell}) \\ f_{\Sigma}(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi_1, s_1), \dots, (\xi_n, s_n)) &= \sum_{s'_1, \dots, s'_n \in \Sigma'} \int d\xi'_1 \dots d\xi'_n f(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi'_1, s'_1), \dots, (\xi'_n, s'_n)) \prod_{\ell=1}^n \hat{\chi}_{s_{\ell}}(\xi'_{\ell}, \xi_{\ell}) \end{aligned}$$

where χ_s , $s \in \Sigma$ is the partition of unity of Lemma XII.3 and (XIII.2). If φ is translation invariant and antisymmetric under permutation of its η arguments, then $\varphi_{\Sigma} \in \mathcal{F}_m(n; \Sigma)$. For $i = j$ and $\Sigma' = \Sigma$, define $\varphi_{\Sigma} = \varphi$ and $f_{\Sigma} = f$.

Remark XIX.3

i) If $u \in \mathcal{F}_0(2; \Sigma')$ is an antisymmetric, spin independent and particle number conserving function then

$$\check{u}_{\Sigma}(k) = \check{u}(k) \left(\tilde{\nu}^{(\geq j)}(k) \right)^2$$

ii) For a function φ on $\mathcal{B}^m \times (\mathcal{B} \times \Sigma')^n$ one has $(\varphi_\Sigma)^\sim = (\varphi^\sim)_\Sigma$.

iii) Let $j, i_1, i_2 \geq 2$ with $i_2 > i_1$. Let Σ, Σ_1 and Σ_2 be sectorizations at scales j, i_1 and i_2 respectively. Then, for each function φ on $\mathcal{B}^m \times (\mathcal{B} \times \Sigma)^n$ and each function f on $\check{\mathcal{B}}^m \times (\mathcal{B} \times \Sigma)^n$

$$(\varphi_{\Sigma_1})_{\Sigma_2} = \varphi_{\Sigma_2} \quad \text{and} \quad (f_{\Sigma_1})_{\Sigma_2} = f_{\Sigma_2}$$

Proposition XIX.4 *Let $j > i \geq 2$, $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$ and $\frac{1}{M^{i-3/2}} \leq \mathfrak{l}' \leq \frac{1}{M^{(i-1)/2}}$ with $4\mathfrak{l} < \mathfrak{l}'$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length $\mathfrak{l}'$ at scale i , respectively. Let $\varphi \in \mathcal{F}_m(n; \Sigma')$ and $f \in \check{\mathcal{F}}_m(n; \Sigma')$ be particle number conserving functions.*

i) If $m \neq 0$

$$|\varphi_\Sigma|_{1,\Sigma} \leq \text{const}^n \mathfrak{c}_{j-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^n |\varphi|_{1,\Sigma'}$$

ii) If f is antisymmetric in its (ξ, s) arguments, then for all p

$$|f_\Sigma|_{p,\Sigma}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^{n+m-p-1} |f|_{p,\Sigma'}^\sim$$

Moreover, if $\mathfrak{l} \geq \frac{1}{M^{2/3(j-1)}}$, $\mathfrak{l}' \leq \frac{1}{6}\sqrt{\mathfrak{l}}$ and $n \geq 3$

$$|f_\Sigma|_{1,\Sigma}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^{n+m-3} \left(|f|_{1,\Sigma'}^\sim + \frac{1}{\mathfrak{l}'} |f|_{3,\Sigma'}^\sim\right)$$

iii) If f is antisymmetric in its (ξ, s) arguments, then for all p

$$|f_{\Sigma'}|_{p,\Sigma'}^\sim \leq \text{const}^n \mathfrak{c}_{i-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^{p-m} |f|_{p,\Sigma}^\sim$$

Here const is a constant that is independent of M, j, Σ

This Proposition is proved after Lemma XXI.4.

Remark XIX.5 Since for $m = 0$ the norms $|\varphi|_{p,\Sigma}$ and $|\varphi|_{p,\Sigma}^\sim$ agree, Proposition XIX.4.ii implies that, in the case that $\mathfrak{l} \geq \frac{1}{M^{2/3(j-1)}}$ and $4\mathfrak{l} < \mathfrak{l}' < \frac{1}{6}\sqrt{\mathfrak{l}}$, for antisymmetric $\varphi \in \mathcal{F}_0(n; \Sigma')$

$$\begin{aligned} |\varphi_\Sigma|_{1,\Sigma} &\leq \text{const} \mathfrak{c}_{j-1} |\varphi|_{1,\Sigma'} & \text{if } n = 2 \\ |\varphi_\Sigma|_{3,\Sigma} &\leq \text{const} \mathfrak{c}_{j-1} |\varphi|_{3,\Sigma'} & \text{if } n = 4 \\ |\varphi_\Sigma|_{1,\Sigma} &\leq \text{const}^n \mathfrak{c}_{j-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^{n-3} \left(|\varphi|_{1,\Sigma'} + \frac{1}{\mathfrak{l}'} |\varphi|_{3,\Sigma'}\right) & \text{if } n \geq 4 \end{aligned}$$

The resectorization of functions on $\mathfrak{X}_\Sigma^n = (\check{\mathcal{B}} \cup (\mathcal{B} \times \Sigma))^n$ is defined just as in Definition XIX.2. To be precise, recall from Remark XVI.3 and Definition XVI.2.iii that

$$\mathfrak{X}_\Sigma^n = \bigcup_{i_1, \dots, i_n \in \{0,1\}} \mathfrak{X}_{i_1}(\Sigma) \times \dots \times \mathfrak{X}_{i_n}(\Sigma)$$

where $\mathfrak{X}_0(\Sigma) = \check{\mathcal{B}}$ and $\mathfrak{X}_1(\Sigma) = \mathcal{B} \times \Sigma$. Furthermore, for each $\vec{i} = (i_1, \dots, i_n) \in \{0,1\}^n$, the map Ord gives a bijection between functions on $\mathfrak{X}_{i_1}(\Sigma) \times \dots \times \mathfrak{X}_{i_n}(\Sigma)$ and functions on $\check{\mathcal{B}}^{m(\vec{i})} \times (\mathcal{B} \times \Sigma)^{n-m(\vec{i})}$, where $m(\vec{i}) = n - i_1 - \dots - i_n$.

Definition XIX.6 Let $j, i \geq 2$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length $\mathfrak{l}'$ at scale i , respectively.

- i) Let $\vec{i} = (i_1, \dots, i_n) \in \{0,1\}^n$ and f a function on $\mathfrak{X}_{i_1}(\Sigma') \times \dots \times \mathfrak{X}_{i_n}(\Sigma')$. Then f_Σ is the function on $\mathfrak{X}_{i_1}(\Sigma) \times \dots \times \mathfrak{X}_{i_n}(\Sigma)$ determined by $\text{Ord}(f_\Sigma) = (\text{Ord } f)_\Sigma$.
- ii) If f is a function on $\mathfrak{X}_{\Sigma'}^n$, its resectorization f_Σ is the function on $\mathfrak{X}_\Sigma^n$ determined by

$$f_\Sigma|_{\vec{i}} = (f|_{\vec{i}})_\Sigma \quad \text{for all } \vec{i} \in \{0,1\}^n$$

From Proposition XIX.4, we have

Corollary XIX.7 Let $j > i \geq 2$, $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$ and $\frac{1}{M^{i-3/2}} \leq \mathfrak{l}' \leq \frac{1}{M^{(i-1)/2}}$ with $4\mathfrak{l} < \mathfrak{l}'$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length $\mathfrak{l}'$ at scale i , respectively. Let $f \in \check{\mathcal{F}}_{n;\Sigma'}$ be an antisymmetric particle number conserving function. Then for all p

$$|f_\Sigma|_{p,\Sigma}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^{n-p-1} |f|_{p,\Sigma'}^\sim$$

Moreover, if $\mathfrak{l} \geq \frac{1}{M^{2/3(j-1)}}$, $\mathfrak{l}' \leq \frac{1}{6}\sqrt{\mathfrak{l}}$ and $n \geq 4$

$$|f_\Sigma|_{1,\Sigma}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right]^{n-3} \left(|f|_{1,\Sigma'}^\sim + \frac{1}{\mathfrak{l}'} |f|_{3,\Sigma'}^\sim\right)$$

In the renormalization group analysis of [FKTf1–f3], the numbers $\rho_{0;n}$ used as weights in the norms N_j of Definition XV.1 do not depend on the scale j . As pointed out in Remark XV.2, boundedness in j of the norms N_j implies that the coefficient of t^0 in $|w_{0,2}|_{1,\Sigma}$ has positive power counting (that is, tends to zero as a power of $\frac{1}{M^j}$) and the coefficient of t^0 in $|w_{0,4}|_{3,\Sigma}$ has neutral power counting. The other contributions $w_{m,n}$ behave well with respect to resectorization.

Corollary XIX.8 Fix $\frac{1}{2} < \aleph < \frac{2}{3}$ and let $j \geq \frac{3}{2-3\aleph}$. Let Σ_{j+1} and Σ_j be sectorizations of length $\mathfrak{l}_{j+1} = \frac{1}{M^{\aleph(j+1)}}$ at scale $j+1$ and $\mathfrak{l}_j = \frac{1}{M^{\aleph j}}$ at scale j , respectively. Let $\vec{\rho} = (\rho_{m;n})$ be a system of positive real numbers obeying (XV.1) and set

$$\rho'_{m;n} = \begin{cases} \rho_{m;n} & \text{if } m = 0 \\ \sqrt[4]{\frac{\mathfrak{l}_j M^j}{\mathfrak{l}_{j+1} M^{j+1}}} \rho_{m;n} = \frac{1}{M^{(1-\aleph)/4}} \rho_{m;n} & \text{if } m > 0 \end{cases}$$

Let

$$w(\phi, \psi) = \sum_{\substack{m,n \\ m+n \text{ even}}} \sum_{s_1, \dots, s_n \in \Sigma_{j+1}} \int d\eta_1 \cdots d\eta_m d\xi_1 \cdots d\xi_n w_{m,n}(\eta_1, \dots, \eta_m(\xi_1, s_1), \dots, (\xi_n, s_n)) \\ \phi(\eta_1) \cdots \phi(\eta_m) \psi((\xi_1, s_1)) \cdots \psi((\xi_n, s_n))$$

with $w_{m,n} \in \mathcal{F}_m(n; \Sigma_j)$, be an even Σ_j -sectorized particle number conserving Grassmann function with $w_{0,2} = 0$ and $w_{m,0} = 0$ for all m . If M is big enough, then

$$N_{j+1}(w_{\Sigma_{j+1}}; 64\alpha; X, \Sigma_{j+1}, \vec{\rho}) \leq \text{const } \mathfrak{e}_{j+1}(X) N_j(w; \frac{\alpha}{2}; X, \Sigma_j, \vec{\rho}')$$

with the constant const independent of M , j , Σ_j and Σ_{j+1} . If, in addition $w_{0,4} = 0$, then

$$N_{j+1}(w_{\Sigma_{j+1}}; 64\alpha; X, \Sigma_{j+1}, \vec{\rho}) \leq \frac{1}{M^{(1-\aleph)/8}} \mathfrak{e}_{j+1}(X) N_j(w; \frac{\alpha}{2}; X, \Sigma_j, \vec{\rho}')$$

Proof: We apply Proposition XIX.4 with j replaced by $j+1$, $i = j$, $\mathfrak{l} = \mathfrak{l}_{j+1}$ and $\mathfrak{l}' = \mathfrak{l}_j$. Observe that the hypotheses of part (ii) are fulfilled. In this proof, use $|\cdot|_{\Sigma, \vec{\rho}}$ to designate the norm of Definition XV.1 using the indicated $\vec{\rho}$.

If $m, n \geq 1$, by Proposition XIX.4.i,

$$\begin{aligned} & \frac{M^{2(j+1)}}{\mathfrak{l}_{j+1}} \mathfrak{e}_{j+1}(X) (64\alpha)^n \left(\frac{\mathfrak{l}_{j+1} B}{M^{j+1}}\right)^{n/2} |(w_{m,n})_{\Sigma_{j+1}}|_{\Sigma_{j+1}, \vec{\rho}} \\ &= \mathfrak{e}_{j+1}(X) (64\alpha)^n \left(\frac{\mathfrak{l}_{j+1} B}{M^{j+1}}\right)^{n/2} \rho_{m;n} |(w_{m,n})_{\Sigma_{j+1}}|_{1, \Sigma_{j+1}} \\ &\leq \text{const}^n \mathfrak{c}_j \mathfrak{e}_{j+1}(X) \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^n \left(\frac{2^{14}}{M} \frac{\mathfrak{l}_{j+1}}{\mathfrak{l}_j}\right)^{n/2} \frac{\rho_{m;n}}{\rho'_{m;n}} \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} \rho'_{m;n} |w_{m,n}|_{1, \Sigma_j} \\ &\leq \text{const}^n \mathfrak{e}_{j+1}(X) \left(\frac{1}{M^{1-\aleph}}\right)^{(2n-1)/4} \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{c}_j \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} |w_{m,n}|_{\Sigma_j, \vec{\rho}'} \\ &\leq \frac{1}{M^{(1-\aleph)/8}} \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{e}_j(X) \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} |w_{m,n}|_{\Sigma_j, \vec{\rho}'} \end{aligned}$$

if M is large enough. If $m = 0$ and $n \geq 4$, by Proposition XIX.4.ii and Remark XVI.5,

$$\begin{aligned}
& \frac{M^{2(j+1)}}{\mathfrak{l}_{j+1}} \mathfrak{e}_{j+1}(X) (64\alpha)^n \left(\frac{\mathfrak{l}_{j+1} B}{M^{j+1}}\right)^{n/2} |(w_{m,n})_{\Sigma_{j+1}}|_{\Sigma_{j+1}, \vec{\rho}} \\
&= \frac{M^{2(j+1)}}{\mathfrak{l}_{j+1}} \mathfrak{e}_{j+1}(X) (64\alpha)^n \left(\frac{\mathfrak{l}_{j+1} B}{M^{j+1}}\right)^{n/2} \rho_{0;n} \\
&\quad \left[|(w_{0,n})_{\Sigma_{j+1}}|_{1, \Sigma_{j+1}} + \frac{1}{\mathfrak{l}_{j+1}} |(w_{0,n})_{\Sigma_{j+1}}|_{3, \Sigma_{j+1}} + \frac{1}{\mathfrak{l}_{j+1}^2} |(w_{0,n})_{\Sigma_{j+1}}|_{5, \Sigma_{j+1}} \right] \\
&\leq \text{const}^n \mathfrak{c}_j \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} \frac{1}{M^{(n-4)/2}} \left(\frac{\mathfrak{l}_{j+1}}{\mathfrak{l}_j}\right)^{(n-2)/2} \rho_{0;n} \\
&\quad \left[\left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{n-3} |w_{0,n}|_{1, \Sigma_j} + \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{n-3} \frac{1}{\mathfrak{l}_j} |w_{0,n}|_{3, \Sigma_j} + \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{n-4} \frac{1}{\mathfrak{l}_j^2} |w_{0,n}|_{5, \Sigma_j} \right] \\
&\leq \text{const}^n \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{c}_j \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} \frac{1}{M^{(n-4)/2}} \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{(n-4)/2} \rho'_{0;n} \\
&\quad \left[|w_{0,n}|_{1, \Sigma_j} + \frac{1}{\mathfrak{l}_j} |w_{0,n}|_{3, \Sigma_j} + \frac{1}{\mathfrak{l}_j^2} |w_{0,n}|_{5, \Sigma_j} \right] \\
&= \text{const}^n \mathfrak{e}_{j+1}(X) \left(\frac{1}{M^{1-\aleph}}\right)^{(n-4)/2} \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{c}_j \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} |w_{0,n}|_{\Sigma_j, \vec{\rho}'} \\
&\leq \left(\frac{1}{M^{(1-\aleph)/8}} + \text{const} \delta_{n,4}\right) \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{e}_j(X) \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} |w_{0,n}|_{\Sigma_j, \vec{\rho}'}
\end{aligned}$$

■

The analog of Corollary XIX.8 for the $N_j^\sim$ norms is

Corollary XIX.9 Fix $\frac{1}{2} < \aleph < \frac{2}{3}$ and let $j \geq \frac{3}{2-3\aleph}$. Let Σ_{j+1} and Σ_j be sectorizations of length $\mathfrak{l}_{j+1} = \frac{1}{M^{\aleph(j+1)}}$ at scale $j+1$ and $\mathfrak{l}_j = \frac{1}{M^{\aleph j}}$ at scale j , respectively. Let $\vec{\rho} = (\rho_{m;n})$ be a system of positive real numbers obeying (XVII.1). Let

$$w(\phi, \psi) = \sum_n \int_{\mathfrak{X}_\Sigma^n} dx_1 \cdots dx_n f_n(x_1, \dots, x_n) \Psi(x_1) \cdots \Psi(x_n)$$

with $f_n \in \check{\mathcal{F}}_{n;\Sigma}$ antisymmetric, be an even Σ_j -sectorized particle number conserving Grassmann function with $f_2 = 0$. If M is big enough, then

$$N_{j+1}^\sim(w_{\Sigma_{j+1}}; 64\alpha; X, \Sigma_{j+1}, \vec{\rho}) \leq \text{const} \mathfrak{e}_{j+1}(X) N_j^\sim(w; \frac{\alpha}{2}; X, \Sigma_j, \vec{\rho})$$

with the constant const independent of M , j , Σ_j and Σ_{j+1} . If, in addition $f_4 = 0$, then

$$N_{j+1}^\sim(w_{\Sigma_{j+1}}; 64\alpha; X, \Sigma_{j+1}, \vec{\rho}) \leq \frac{1}{M^{(1-\aleph)/8}} \mathfrak{e}_{j+1}(X) N_j^\sim(w; \frac{\alpha}{2}; X, \Sigma_j, \vec{\rho})$$

Proof: If $n \geq 4$, by Proposition XIX.4.ii with j replaced by $j+1$, $i = j$, $\mathfrak{l} = \mathfrak{l}_{j+1}$ and $\mathfrak{l}' = \mathfrak{l}_j$,

$$\begin{aligned}
& \frac{M^{2(j+1)}}{\mathfrak{l}_{j+1}} \mathfrak{e}_{j+1}(X) (64\alpha)^n \left(\frac{\mathfrak{l}_{j+1} B}{M^{j+1}}\right)^{n/2} |(f_n)_{\Sigma_{j+1}}|_{\Sigma_{j+1}}^{\sim} \\
& \leq \frac{M^{2(j+1)}}{\mathfrak{l}_{j+1}} \mathfrak{e}_{j+1}(X) (64\alpha)^n \left(\frac{\mathfrak{l}_{j+1} B}{M^{j+1}}\right)^{n/2} \left\{ |(f_n)_{\Sigma_{j+1}}|_{1, \Sigma_{j+1}, \vec{\rho}}^{\sim} + \sum_{p=2}^6 \frac{1}{\mathfrak{l}_{j+1}^{\lfloor (p-1)/2 \rfloor}} |(f_n)_{\Sigma_{j+1}}|_{p, \Sigma_{j+1}, \vec{\rho}}^{\sim} \right\} \\
& \leq \text{const}^n \mathfrak{c}_j \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} \frac{1}{M^{(n-4)/2}} \left(\frac{\mathfrak{l}_{j+1}}{\mathfrak{l}_j}\right)^{(n-2)/2} \\
& \quad \left\{ \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{n-3} (|f_n|_{1, \Sigma_j, \vec{\rho}}^{\sim} + \frac{1}{\mathfrak{l}_j} |f_n|_{3, \Sigma_j, \vec{\rho}}^{\sim}) + \sum_{p=2}^6 \frac{1}{\mathfrak{l}_{j+1}^{\lfloor (p-1)/2 \rfloor}} \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{n-p-1} |f_n|_{p, \Sigma_j, \vec{\rho}}^{\sim} \right\} \\
& \leq \text{const}^n \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{c}_j \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} \frac{1}{M^{(n-4)/2}} \left(\frac{\mathfrak{l}_j}{\mathfrak{l}_{j+1}}\right)^{(n-4)/2} \\
& \quad \left\{ |f_n|_{1, \Sigma_j, \vec{\rho}}^{\sim} + \frac{1}{\mathfrak{l}_j} |f_n|_{3, \Sigma_j, \vec{\rho}}^{\sim} + \sum_{p=2}^6 \left(\frac{\mathfrak{l}_{j+1}}{\mathfrak{l}_j}\right)^{p-2-\lfloor (p-1)/2 \rfloor} \frac{1}{\mathfrak{l}_j^{\lfloor (p-1)/2 \rfloor}} |f_n|_{p, \Sigma_j, \vec{\rho}}^{\sim} \right\} \\
& \leq \text{const}^n \mathfrak{e}_{j+1}(X) \left(\frac{1}{M^{1-\mathfrak{N}}}\right)^{(n-4)/2} \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{e}_j(X) \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} |f_n|_{\Sigma_j}^{\sim} \\
& \leq \left(\frac{1}{M^{(1-\mathfrak{N})/8}} + \text{const} \delta_{n,4}\right) \mathfrak{e}_{j+1}(X) \frac{M^{2j}}{\mathfrak{l}_j} \mathfrak{e}_j(X) \left(\frac{\alpha}{2}\right)^n \left(\frac{\mathfrak{l}_j B}{M^j}\right)^{n/2} |f_n|_{\Sigma_j}^{\sim}
\end{aligned}$$

■

The positive power counting of $|w_{0,2}|_{1,\Sigma}$ is achieved by renormalization. That is, we choose the counterterm in such a way that, at each scale, the restriction of the Fourier transform of $w_{0,2}$ to the Fermi surface is small. The following Proposition ensures that then $|w_{0,2}|_{1,\Sigma}$ is also small.

Definition XIX.10 The function $u \in \mathcal{F}_0(2; \Sigma)$ is said to vanish at $k_0 = 0$ if

$$\check{u}(((0, \mathbf{k}), \sigma, a, s), ((0, \mathbf{k}), \sigma', a', s')) = 0$$

for all $a, a' \in \{0, 1\}$, $\sigma, \sigma' \in \{\uparrow, \downarrow\}$ and $s, s' \in \Sigma$.

Proposition XIX.11 *There is a constant const , independent of M , such that the following holds: Let $j \geq i \geq 2$ and Σ and Σ' be sectorizations at scale j and i , respectively. If $i = j$ assume that $\Sigma = \Sigma'$. Let $u \in \mathcal{F}_0(2; \Sigma')$ be a function that vanishes at $k_0 = 0$. Then*

i)

$$|u_{\Sigma}|_{1,\Sigma} \leq \text{const} \frac{1}{M^{j-1}} \mathfrak{c}_{j-1} |\mathcal{D}_{1,2}^{(1,0,0)} u|_{1,\Sigma'} + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 \neq 0}} \infty t^{\delta}$$

ii)

$$|\mathcal{D}_{1,2}^{(1,0,0)} u_{\Sigma}|_{1,\Sigma} \leq \text{const} \mathfrak{c}_{j-1} |\mathcal{D}_{1,2}^{(1,0,0)} u|_{1,\Sigma'}$$

Proof: i) Fix $s_1, s_2 \in \Sigma$. If $i < j$, by Lemma II.7, Lemma IX.6.i, Lemma XIII.3 and (XIII.4)

$$\begin{aligned}
\|u_\Sigma((\xi_1, s_1), (\xi_2, s_2))\|_{1,\infty} &\leq \text{const} \max_{s'_1, s'_2 \in \Sigma'} \left\| \int d\eta_1 d\eta_2 u((\eta_1, s'_1), (\eta_2, s'_2)) \hat{\chi}_{s_1}(\eta_1, \xi_1) \hat{\chi}_{s_2}(\eta_2, \xi_2) \right\|_{1,\infty} \\
&\leq \text{const} \|\hat{\chi}_{s_2}\|_{1,\infty} \max_{s'_1, s'_2 \in \Sigma'} \left\| \int d\eta_1 u((\eta_1, s'_1), (\cdot, s'_2)) \hat{\chi}_{s_1}(\eta_1, \cdot) \right\|_{1,\infty} \\
&\leq \text{const} \mathbf{c}_{j-1} \left\| \frac{\partial \chi_{s_1}'}{\partial x_0} \right\|_{L^1} \max_{s'_1, s'_2 \in \Sigma'} \left\| \mathcal{D}_{1,2}^{(1,0,0)} u((\cdot, s'_1), (\cdot, s'_2)) \right\|_{1,\infty} + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 \neq 0}} \infty t^\delta \\
&\leq \text{const} \frac{1}{M^{j-1}} \mathbf{c}_{j-1}^2 \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma'} + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 \neq 0}} \infty t^\delta \\
&\leq \text{const} \frac{1}{M^{j-1}} \mathbf{c}_{j-1} \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma'} + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 \neq 0}} \infty t^\delta
\end{aligned}$$

Similarly, if $i = j$ and $\Sigma = \Sigma'$, then setting

$$\chi_s^{(e)}(k) = \varphi\left(\frac{1}{2}M^{2j-2}(k_0^2 + e(\mathbf{k})^2)\right) \Theta_s(\mathbf{k}'(k))$$

(which just differs by a $\frac{1}{2}$ from the definition of $\chi_s(k)$ in (XIII.2)), we have, using the support property of Definition XII.4.ii,

$$\begin{aligned}
\|u_\Sigma((\xi_1, s_1), (\xi_2, s_2))\|_{1,\infty} &= \|u((\xi_1, s_1), (\xi_2, s_2))\|_{1,\infty} \\
&= \left\| \sum_{s'_1, s'_2 \in \Sigma} \int d\eta_1 d\eta_2 u((\eta_1, s_1), (\eta_2, s_2)) \hat{\chi}_{s'_1}^{(e)}(\eta_1, \xi_1) \hat{\chi}_{s'_2}^{(e)}(\eta_2, \xi_2) \right\|_{1,\infty} \\
&\leq \text{const} \max_{s'_1, s'_2 \in \Sigma} \left\| \int d\eta_1 d\eta_2 u((\eta_1, s_1), (\eta_2, s_2)) \hat{\chi}_{s'_1}^{(e)}(\eta_1, \xi_1) \hat{\chi}_{s'_2}^{(e)}(\eta_2, \xi_2) \right\|_{1,\infty} \\
&\leq \text{const} \frac{1}{M^{j-1}} \mathbf{c}_{j-1} \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma} + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 \neq 0}} \infty t^\delta
\end{aligned}$$

Since for every $s_1 \in \Sigma$ there are at most three sectors s_2 with $\tilde{s}_1 \cap \tilde{s}_2 \neq \emptyset$, in both cases

$$\|u_\Sigma\|_{1,\Sigma} \leq \text{const} \frac{1}{M^{j-1}} \mathbf{c}_{j-1} \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma'} + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 \neq 0}} \infty t^\delta$$

ii) If $i = j$ and $\Sigma = \Sigma'$ the statement is trivial. So assume that $i < j$. Fix $s_1, s_2 \in \Sigma$. By

Lemma IX.6.ii (twice), Lemma XIII.3 and (XIII.4)

$$\begin{aligned}
& \left\| \mathcal{D}_{1,2}^{(1,0,0)} u_{\Sigma}((\xi_1, s_1), (\xi_2, s_2)) \right\|_{1,\infty} \\
& \leq \text{const} \max_{s'_1, s'_2 \in \Sigma'} \left\| \mathcal{D}_{1,2}^{(1,0,0)} \int d\eta_1 d\eta_2 u((\eta_1, s'_1), (\eta_2, s'_2)) \hat{\chi}_{s_1}(\eta_1, \xi_1) \hat{\chi}_{s_2}(\eta_2, \xi_2) \right\|_{1,\infty} \\
& \leq \text{const} \left(\|\hat{\chi}_{s_2}\|_{1,\infty} + \left\| x_0 \frac{\partial \chi'_{s_2}}{\partial x_0}(x) \right\|_{L^1} \right) \max_{s'_1, s'_2 \in \Sigma'} \left\| \mathcal{D}_{1,2}^{(1,0,0)} \int d\eta_1 u((\eta_1, s'_1), (\cdot, s'_2)) \hat{\chi}_{s_1}(\eta_1, \cdot) \right\|_{1,\infty} \\
& \quad + \sum_{\substack{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^d \\ \delta_0 > r_0}} \infty t^\delta \\
& \leq \text{const} \mathfrak{c}_{j-1} \left(\|\hat{\chi}_{s_1}\|_{1,\infty} + \left\| x_0 \frac{\partial \chi'_{s_1}}{\partial x_0}(x) \right\|_{L^1} \right) \max_{s'_1, s'_2 \in \Sigma'} \left\| \mathcal{D}_{1,2}^{(1,0,0)} u((\cdot, s'_1), (\cdot, s'_2)) \right\|_{1,\infty} \\
& \leq \text{const} \mathfrak{c}_{j-1} \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma'}
\end{aligned}$$

■

Corollary XIX.12 *There is a constant const , independent of M , such that the following holds: Let Σ be a sectorization of scale $j \geq 2$ and $u \in \mathcal{F}_0(2; \Sigma)$ be a function that vanishes at $k_0 = 0$. Let $X \in \mathfrak{N}_{d+1}$. If*

$$\left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma} \leq \mathfrak{c}_{j-1} X + \sum_{\delta_0=r_0} \infty t^\delta$$

then

$$|u|_{1,\Sigma} \leq \text{const} \frac{M}{M^j} \mathfrak{c}_{j-1} X$$

Proof: By Proposition XIX.11.i and (XIII.4)

$$|u|_{1,\Sigma} \leq \text{const} \frac{1}{M^{j-1}} \mathfrak{c}_{j-1} \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma} + \sum_{\delta_0 \neq 0} \infty t^\delta \leq \text{const} \frac{1}{M^{j-1}} \mathfrak{c}_{j-1} X + \sum_{\delta_0 \neq 0} \infty t^\delta$$

Also

$$\begin{aligned}
|u|_{1,\Sigma} & \leq t_0 \frac{\partial}{\partial t_0} |u|_{1,\Sigma} + \sum_{\delta_0=0} \infty t^\delta \\
& = t_0 \left| \mathcal{D}_{1,2}^{(1,0,0)} u \right|_{1,\Sigma} + \sum_{\delta_0=0} \infty t^\delta \\
& \leq t_0 \mathfrak{c}_{j-1} X + \sum_{\delta_0=r_0+1} \infty t^\delta + \sum_{\delta_0=0} \infty t^\delta \\
& \leq \frac{1}{M^{j-1}} \mathfrak{c}_{j-1} X + \sum_{\delta_0=0} \infty t^\delta
\end{aligned}$$

since $t_0 \mathfrak{c}_{j-1} \leq \frac{1}{M^{j-1}} \mathfrak{c}_{j-1}$. The Corollary now follows by taking the minimum of the two estimates on $|u|_{1,\Sigma}$. ■

Corollary XIX.13 *Let $j > i \geq 2$ and Σ and Σ' be sectorizations at scale j and i , respectively. Let $u \in \mathcal{F}_0(2; \Sigma')$ vanish at $k_0 = 0$. Assume that $|u|_{1, \Sigma'} \leq \lambda \mathbf{c}_i$ for some $\lambda > 0$. Then*

$$|u_\Sigma|_{1, \Sigma} \leq \text{const } \lambda M^{\frac{M^i}{M^j}} \mathbf{c}_{j-1}$$

Proof: By hypothesis

$$|\mathcal{D}_{1,2}^{(1,0,0)} u|_{1, \Sigma'} \leq \text{const } \lambda M^i \mathbf{c}_i + \sum_{\delta_0 \neq 0} \infty t^\delta$$

Therefore, by Proposition XIX.11.i and (XIII.4)

$$|u_\Sigma|_{1, \Sigma} \leq \text{const } \frac{1}{M^{j-1}} \mathbf{c}_{j-1} |\mathcal{D}_{1,2}^{(1,0,0)} u|_{1, \Sigma'} + \sum_{\delta_0 \neq 0} \infty t^\delta \leq \text{const } \lambda \frac{M^i}{M^{j-1}} \mathbf{c}_{j-1} + \sum_{\delta_0 \neq 0} \infty t^\delta$$

Also, by Proposition XIX.11.ii

$$\begin{aligned} |u_\Sigma|_{1, \Sigma} &\leq t_0 |\mathcal{D}_{1,2}^{(1,0,0)} u_\Sigma|_{1, \Sigma} + \sum_{\delta_0 = 0} \infty t^\delta \\ &\leq \text{const } (t_0 \mathbf{c}_{j-1}) |\mathcal{D}_{1,2}^{(1,0,0)} u|_{1, \Sigma'} + \sum_{\delta_0 = 0} \infty t^\delta \\ &\leq \text{const } \left(\frac{1}{M^{j-1}} \mathbf{c}_{j-1} \right) \lambda M^i \mathbf{c}_i + \sum_{\delta_0 = r_0+1} \infty t^\delta + \sum_{\delta_0 = 0} \infty t^\delta \\ &\leq \text{const } \lambda \frac{M^i}{M^{j-1}} \mathbf{c}_{j-1} + \sum_{\delta_0 = 0} \infty t^\delta \end{aligned}$$

Again, the Corollary follows by taking the minimum of the two estimates on $|u_\Sigma|_{1, \Sigma}$. ■

When we start the multi scale analysis in [FKTf2], the effective potential after integrating out the first scales does not have a natural sectorized representative (see also Theorem VIII.6). Therefore we need analogs of Definition XIX.2 and Proposition XIX.4 that pass from unsectorized functions to sectorized functions (see also Example XII.5).

Definition XIX.14 Let Σ be a sectorization of scale $j \geq 2$. For a function f on $\mathcal{B}^m \times \mathcal{B}^n$ define the function f_Σ on $\mathcal{B}^m \times (\mathcal{B} \times \Sigma)^n$ by

$$f_\Sigma(\eta_1, \dots, \eta_m; (\xi_1, s_1), \dots, (\xi_n, s_n)) = \int \prod_{i=1}^n (d\xi'_i \chi_{s_i}(\xi'_i, \xi_i)) f(\eta_1, \dots, \eta_m; \xi'_1, \dots, \xi'_n)$$

where χ_s is the partition of unity of Lemma XII.3.

Proposition XIX.15 *Let Σ be a sectorization of scale $j \geq 0$ and $f \in \mathcal{F}_m(n)$, $f' \in \check{\mathcal{F}}_m(n)$ particle number conserving functions that are antisymmetric in their ξ -variables.*

i) If $m = 0$ and f is translation invariant, then for all $p < n$

$$|f_\Sigma|_{p,\Sigma} \leq \text{const}^n \frac{1}{\mathfrak{l}^{n-p-1}} \mathfrak{c}_{j-1} \|f\|_{1,\infty}$$

ii) If $m \neq 0$

$$|f_\Sigma|_{1,\Sigma} \leq \left[\frac{\text{const}}{\mathfrak{l}}\right]^n \mathfrak{c}_{j-1} \|f\|_{1,\infty}$$

iii) If $0 < m \leq p \leq m + n$

$$|f'_\Sigma|_{p,\Sigma}^\sim \leq \left[\frac{\text{const}}{\mathfrak{l}}\right]^{m+n-p} \mathfrak{c}_{j-1} \|f\|^\sim$$

The proof of part (i) of this Proposition is analogous to that of Proposition XIX.4, and part (ii) was already proven in Example XII.10. The proof of part (iii) is similar to that of part (ii).

XX. Sums of Momenta and ϵ – separated Sets

In the next section we shall exploit conservation of momentum to prove Proposition XIX.1, relating the 1– and 3–norms of a four–legged kernel, and Proposition XIX.4, concerning the behaviour of norms under change of sectorization. Conservation of momentum is equivalent to translation invariance in position space.

The following Definition is motivated by Definition B.1.N of [FKTo2], of conservation of particle number, and Definition XVI.7.i, of the spaces $\check{\mathcal{F}}_m(n; \Sigma)$.

Definition XX.1 A configuration $(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_n) \in \check{\mathcal{B}}^m \times \Sigma^n$, where Σ is a sectorization of some scale j , is consistent with conservation of momentum for the sequence $(a_1, \dots, a_n)$ of creation–annihilation indices if there are $k_1, \dots, k_n \in \mathbb{R} \times \mathbb{R}^2$, with k_i in the extended sector $\tilde{s}_i$ for each $i = 1, \dots, n$, such that

$$\sum_{i=1}^m (-1)^{b_i} p_i + \sum_{i=1}^n (-1)^{a_i} k_i = 0$$

where $\check{\eta}_i = (p_i, \sigma_i, b_i)$.

We say that the configuration $(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_n)$ is consistent with conservation of momentum if it is consistent with conservation of momentum for some sequence $(a_1, \dots, a_n) \in \{0, 1\}^n$ of creation–annihilation indices such that

$$\#\{ i \mid a_i = 0 \} + \#\{ \ell \mid b_\ell = 0 \} = \#\{ i \mid a_i = 1 \} + \#\{ \ell \mid b_\ell = 1 \}$$

Remark XX.2 Let Σ be a sectorization of scale j .

i) If $f \in \check{\mathcal{F}}_m(n; \Sigma)$ preserves particle number then

$$f(\check{\eta}_1, \dots, \check{\eta}_m; (\cdot, s_1), \dots, (\cdot, s_n)) = 0$$

unless the configuration $(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_n)$ is consistent with conservation of momentum.

ii) If a configuration $(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_n)$ is consistent with conservation of momentum for the sequence $(a_1, \dots, a_n)$ of creation–annihilation indices then there are $\mathbf{k}_1, \dots, \mathbf{k}_n \in \mathbb{R}^2$ such that

$$\sum_{i=1}^m (-1)^{b_i} \mathbf{p}_i + \sum_{i=1}^n (-1)^{a_i} \mathbf{k}_i = \mathbf{0}$$

and

$$\pi_F((0, \mathbf{k}_i)) \in s \quad , \quad |e(\mathbf{k}_i)| \leq \frac{\sqrt{2}}{M^{j-1}}$$

for $i = 1, \dots, n$.

The comparison of the 1- and 3- norms of a four-legged kernel (Proposition XIX.1) uses an estimate on the maximal number of triples (s_2, s_3, s_4) of sectors that complete a given sector s_1 to a quadruple (s_1, s_2, s_3, s_4) that is consistent with conservation of momentum (Proposition XX.10). Similarly, the estimate on the behaviour of norms under change of sectorization (Proposition XIX.4) is based on estimates of the number of $(2n)$ -tuples $(s_1, \dots, s_{2n})$ of sectors that are consistent with conservation of momentum and such that each s_i intersects a given bigger sector from another sectorization (Proposition XX.11).

We reduce these counting problems to problems of estimating volumes of sets in momentum space that are characterized by the geometric constraints that the sectors are required to satisfy. To pass from volume estimates to sector counting we use the concept of ϵ -separated sets (see also [G, p.22]).

ϵ – separated sets

Let M be a Riemannian manifold of dimension n . For any two points $x, y \in M$ we denote by $d(x, y)$ the distance between x and y in M . For $x \in M$ and $r > 0$ let

$$B_r(x) = \{ y \in M \mid d(x, y) < r \}$$

be the open ball of radius r around x . We set, for $\epsilon > 0$,

$$V_{M,\epsilon} = \inf_{x \in M, 0 < r \leq \epsilon} \frac{1}{r^n} \text{vol } B_{r/2}(x)$$

where vol denotes the volume with respect to the Riemannian metric on M . For a subset $A \subset M$ and $\delta > 0$ we call

$$A_\delta = \{ x \in M \mid \inf_{y \in A} d(x, y) \leq \delta \}$$

the (closed) δ -neighbourhood of A . If X is a tangent vector to M at the point x we denote by $\|X\|$ the length of X with respect to the Riemannian metric on M .

If f is a differentiable map from M to another Riemannian manifold N we denote by $Df(x)$ the derivative of f at the point $x \in M$. The point x is said to be a critical point of f if $Df(x)$ has rank strictly less than the dimension of N .

Definition XX.3 Let $\epsilon > 0$. A subset Γ of M is called ϵ -separated if for any two different $\gamma, \gamma' \in \Gamma$

$$d(\gamma, \gamma') \geq \epsilon$$

Example. Let Σ be a sectorization of length l and let Γ be the set of centers of the intervals $s \cap F$, $s \in \Sigma$. If $\epsilon < 7l/8$, then Γ is an ϵ -separated subset of the Fermi curve F and more generally Γ^n is an ϵ -separated subset of F^n .

We wish to count, for example, for a given sector s_4 , the number of triples of sectors (s_1, s_2, s_3) such that there exist $\mathbf{k}_i \in s_i$ obeying $\mathbf{k}_1 + \mathbf{k}_2 - \mathbf{k}_3 - \mathbf{k}_4 = 0$. If (s_1, s_2, s_3) are such sectors, then the map

$$f : F \times F \times F \longrightarrow \mathbb{R}^2$$

$$(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \longmapsto \mathbf{k}_1 + \mathbf{k}_2 - \mathbf{k}_3$$

maps $F^3 \cap (s_1 \times s_2 \times s_3)$ to a neighbourhood of s_4 . We start with an abstract lemma counting the number of points of an ϵ -separated set Γ in the preimage of a specified set A under a specified map f .

Lemma XX.4 *Let M be a Riemannian manifold of dimension n and $f : M \mapsto \mathbb{R}^d$ a differentiable map. For $x \in M$ denote by $Df(x)$ the derivative of f at the point x . Let $\vec{n}_1, \dots, \vec{n}_d$ be an orthonormal basis of $\mathbb{R}^d$. Set, for $i = 1, \dots, d$*

$$C_i = \sup_{x \in M} \sup \{ |\vec{n}_i \cdot Df(x)v| \mid v \text{ is a unit tangent vector to } M \text{ at } x \}$$

Furthermore, for any subset A of $\mathbb{R}^d$ and any $\epsilon > 0$ set

$$A'(\epsilon) = \left\{ y \in \mathbb{R}^d \mid \exists (t_1, \dots, t_d) \in (-\epsilon, \epsilon)^d \text{ such that } y + \sum_{i=1}^d t_i C_i \vec{n}_i \in A \right\}$$

Then for all $A \subset \mathbb{R}^d$, $\epsilon_0 > 0$, $0 < \epsilon < \epsilon_0$ and all ϵ -separated subsets Γ of M

$$\#(f^{-1}(A) \cap \Gamma) \leq \frac{1}{\epsilon^n V_{M, \epsilon_0}} \text{vol}(f^{-1}(A'(\epsilon)))$$

Proof: If $\gamma \in f^{-1}(A) \cap \Gamma$ and $x \in M$ with $d(x, \gamma) < \epsilon/2$, then, by the assumption on the derivative of f for $i = 1, \dots, d$

$$|\vec{n}_i \cdot (f(x) - f(\gamma))| < C_i \epsilon$$

so that $f(x) \in A'(\epsilon)$. Obviously the sets $B_{\epsilon/2}(\gamma)$, $\gamma \in f^{-1}(A) \cap \Gamma$ are pairwise disjoint. Consequently, by the definition of V_{M, ϵ_0}

$$\begin{aligned} V_{M, \epsilon_0} \epsilon^n \#(f^{-1}(A) \cap \Gamma) &\leq \sum_{\gamma \in f^{-1}(A) \cap \Gamma} \text{vol}(B_{\epsilon/2}(\gamma)) \\ &= \text{vol} \left(\bigcup_{\gamma \in f^{-1}(A) \cap \Gamma} B_{\epsilon/2}(\gamma) \right) \\ &\leq \text{vol}(f^{-1}(A'(\epsilon))) \end{aligned}$$

■

Sums of Momenta

For the proofs of Propositions XX.10 and XX.11 we shall apply the discussion of the previous subsection with Γ being the set of centers of sectors of a given sectorization. The proofs of these Propositions then lead to the problem of estimating the number of points $(\mathbf{k}_1, \dots, \mathbf{k}_n, \mathbf{k}_{n+1}, \dots, \mathbf{k}_{2n-1}) \in \Gamma^{2n-1}$ such that $\mathbf{k}_1 + \dots + \mathbf{k}_n - \mathbf{k}_{n+1} - \dots - \mathbf{k}_{2n-1}$ is close to $\mathbf{q}$. Thus we are lead to studying the maps

$$F^{2n-1} \longrightarrow \mathbb{R}^2$$

$$(\mathbf{k}_1, \dots, \mathbf{k}_n, \mathbf{k}_{n+1}, \dots, \mathbf{k}_{2n-1}) \longmapsto \mathbf{k}_1 + \dots + \mathbf{k}_n - \mathbf{k}_{n+1} - \dots - \mathbf{k}_{2n-1}$$

and the intersection of preimages of sets in $\mathbb{R}^2$ with Γ^{2n-1} . Outside a neighbourhood of the set of critical points of this map this can usually be done using Lemma XX.4. The critical points of the map are exactly those points $(\mathbf{k}_1, \dots, \mathbf{k}_{2n-1}) \in F^{2n-1}$ for which the tangent lines of F at $\mathbf{k}_1, \dots, \mathbf{k}_{2n-1}$ are all parallel. This is the case if and only all the points $\mathbf{k}_2, \dots, \mathbf{k}_{2n-1}$ coincide either with $\mathbf{k}_1$ or its antipode $a(\mathbf{k}_1)$.

For $\mathbf{k} \in F$ and $0 < \Lambda \leq \mathfrak{l}$, we call

$$s_{\Lambda, \mathfrak{l}}(\mathbf{k}) = \{ \mathbf{q} \in \mathbb{R}^2 \mid |e(\mathbf{q})| \leq \Lambda, d_F(\mathbf{q}', \mathbf{k}) \leq \mathfrak{l}/2 \}$$

the two dimensional sector of length $\mathfrak{l}$ and width Λ around $\mathbf{k}$. Here $\mathbf{q} \mapsto \mathbf{q}'$ is the projection to the Fermi curve introduced in §XI and used in Definition XII.1.i of [FKTo3] and d_F is the intrinsic metric on F .

Near critical points of the map discussed above we shall use

Proposition XX.5 *Let $\mathbf{k}, \mathbf{k}_1, \dots, \mathbf{k}_{2n-3} \in F$ and $\omega > 0$ be such that for $i = 1, \dots, 2n-3$ one has $\|\mathbf{k}_i - \mathbf{k}\| < \omega$ or $\|\mathbf{k}_i - a(\mathbf{k})\| < \omega$. Let $\epsilon_1, \dots, \epsilon_{2n-3} \in \{\pm 1\}$ and set*

$$\mathbf{q} = \epsilon_1 \mathbf{k}_1 + \dots + \epsilon_{2n-3} \mathbf{k}_{2n-3}$$

Furthermore, let $0 < \Lambda \leq \mathfrak{l} \leq \omega$ and let $\vec{\mathfrak{n}}$ resp. $\vec{\mathfrak{t}}$ be unit normal resp. tangent vector of F at $\mathbf{k}$. Then

$$\{ \epsilon_1 x_1 + \dots + \epsilon_{2n-3} x_{2n-3} \mid x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i) \}$$

is contained in the rectangle

$$\{ \mathbf{q} + t_1 \vec{\mathfrak{n}} + t_2 \vec{\mathfrak{t}} \mid |t_1| \leq n \text{ const} (\Lambda + \mathfrak{l}\omega), |t_2| \leq 4n\mathfrak{l} \}$$

The constant const depends only on the geometry of F .

Proof: Without loss of generality we may assume that $\vec{n} = (0, 1)$ and $\vec{t} = (1, 0)$. The angle between F and the k_1 direction at a point $\mathbf{q} \in F$ is bounded by $\text{const} \|\mathbf{q} - \mathbf{k}\|$ and $\text{const} \|\mathbf{q} - a(\mathbf{k})\|$. Therefore $s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i)$ is contained in a rectangle that is centered at $\mathbf{k}_i$ and has two edges parallel to the k_1 axis of length $2\mathfrak{l}$ and two edges parallel to the k_2 axis of length $\text{const} (\Lambda + \mathfrak{l} \min \{\|\mathbf{k}_i - \mathbf{k}\|, \|\mathbf{k}_i - a(\mathbf{k})\|\}) \leq \text{const} (\Lambda + \mathfrak{l}\omega)$. The claim now follows. $\blacksquare$

Proposition XX.6 *Let $\mathbf{k}, \mathbf{k}_1, \dots, \mathbf{k}_{2n-1} \in F$, $I \subset \{1, \dots, n\}$, $J \subset \{n+1, \dots, 2n-1\}$ and ω a positive real number smaller than the diameter of F such that $\|\mathbf{k}_i - \mathbf{k}\| < \omega$ for $i \in I \cup J$ and $\|\mathbf{k}_j - a(\mathbf{k})\| < \omega$ for $j \notin I \cup J$. Furthermore, let $\mathbf{p} \in \mathbb{R}^2$ and $0 < \Lambda \leq \mathfrak{l} \leq \omega$. Assume that there are points $x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i)$, $i = 1, \dots, 2n-1$ such that*

$$\|x_1 + \dots + x_n - x_{n+1} - \dots - x_{2n-1} - \mathbf{p}\| \leq 2\mathfrak{l}$$

Then

i)

$$\|\mathbf{p} - (|I| - |J|)\mathbf{k} + (|I| - |J| - 1)a(\mathbf{k})\| \leq \text{const } n\omega$$

ii) If $\mathbf{p} \in F$ then

$$\|\mathbf{p} - \mathbf{k}\| \leq \text{const } n\omega \quad \text{or} \quad \|\mathbf{p} - a(\mathbf{k})\| \leq \text{const } n\omega$$

The constants const depend only on the geometry of F .

Proof: By Proposition XX.5,

$$\begin{aligned} & \left\| x_1 + \dots + x_n - x_{n+1} - \dots - x_{2n-1} - (\mathbf{k}_1 + \dots + \mathbf{k}_n - \mathbf{k}_{n+1} - \dots - \mathbf{k}_{2n-1}) \right\| \\ & \leq (n+1)\text{const} (\Lambda + \mathfrak{l}\omega) + 4(n+1)\mathfrak{l} \leq \text{const } n\omega \end{aligned}$$

Since

$$\|\mathbf{k}_1 + \dots + \mathbf{k}_n - \mathbf{k}_{n+1} - \dots - \mathbf{k}_{2n-1} - |I|\mathbf{k} - (n - |I|)a(\mathbf{k}) + |J|\mathbf{k} + (n - 1 - |J|)a(\mathbf{k})\| \leq \text{const } n\omega$$

part (i) follows. To prove part (ii) assume that $\mathbf{p} \in F$. Set $r = |I|$, $s = |J|$. By possibly interchanging $\mathbf{k}$ with its antipode, we may assume that $r \geq s$. If $r = s$ or $r = s + 1$ part (ii) it follows directly from part (i) that $\|\mathbf{p} - \mathbf{k}\| \leq \text{const } n\omega$. So we assume that $r - s \geq 2$.

Let $x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i)$, $i = 1, \dots, 2n-1$ such that

$$y = x_1 + \dots + x_n - x_{n+1} - \dots - x_{2n-1}$$

has distance at most $2\mathfrak{l}$ from $\mathbf{p}$. Let $\vec{n}$ be the outward pointing unit normal vector of F at $\mathbf{k}$. Then $(\mathbf{k} - a(\mathbf{k})) \cdot \vec{n} \geq \text{const}_1$ and

$$|(x_i - \mathbf{k}) \cdot \vec{n}| \leq \|x_i - \mathbf{k}_i\| + \|\mathbf{k}_i - \mathbf{k}\| \leq \text{const}(\Lambda + \mathfrak{l}) + \omega \leq \text{const} \omega$$

for $i \in I \cup J$. Similarly for $j \notin I \cup J$

$$|(x_j - a(\mathbf{k})) \cdot \vec{n}| \leq \text{const} \omega$$

Consequently

$$\left| (x_1 + \cdots + x_n - x_{n+1} - \cdots - x_{2n-1} - \mathbf{k}) \cdot \vec{n} - (r - s - 1)(\mathbf{k} - a(\mathbf{k})) \cdot \vec{n} \right| \leq (2n - 1) \text{const} \omega$$

and therefore

$$(y - \mathbf{k}) \cdot \vec{n} \geq A((r - s - 1) - \text{const} n \omega)$$

with strictly positive constants A, const .

The tangent line to F at $\mathbf{k}$ is a “supporting hyperplane” for the convex hull of F . Therefore

$$F \cap \{ x \in \mathbb{R}^2 \mid (x - \mathbf{k}) \cdot \vec{n} > 0 \} = \emptyset$$

So

$$\begin{aligned} 0 &\geq (\mathbf{p} - \mathbf{k}) \cdot \vec{n} = (\mathbf{p} - y) \cdot \vec{n} + (y - \mathbf{k}) \cdot \vec{n} \\ &\geq (\mathbf{p} - y) \cdot \vec{n} + A((r - s - 1) - n \text{const} \omega) \end{aligned}$$

As $|(\mathbf{p} - y) \cdot \vec{n}| \leq 2\mathfrak{l}$ and hence $(\mathbf{p} - y) \cdot \vec{n} \geq -2\mathfrak{l} \geq -2\omega \geq -n \text{const} \omega$, this shows that

$$n \geq \text{const}' \frac{r-s-1}{\omega} \geq \text{const}' \frac{1}{\omega}$$

since $r - s \geq 2$. Thus $n\omega$ is larger than some strictly positive constant and the estimate of part (ii) holds. ■

Pairs of Momenta

Lemma XX.7 *Let $\epsilon_1, \epsilon_2 \in \{\pm 1\}$. There is a subset X of $F \times F$ and a constant C such that*

i) For every $\mathbf{p} \in \mathbb{R}^2$

$$\#\{ (\mathbf{k}_1, \mathbf{k}_2) \in X \mid \epsilon_1 \mathbf{k}_1 + \epsilon_2 \mathbf{k}_2 = \mathbf{p} \} \leq C$$

ii) $(F \times F) \setminus X$ has measure zero.

Proof: We may assume that $\epsilon_1 = +1$. If $\epsilon_2 = -1$, then we claim that, for every $\mathbf{p} \neq 0$

$$\#\{ (\mathbf{k}_1, \mathbf{k}_2) \in F \times F \mid \mathbf{k}_1 - \mathbf{k}_2 = \mathbf{p} \} \leq 2 \quad (\text{XX.1})$$

In this case, the Lemma with $C = 2$ and $X = \{ (\mathbf{k}_1, \mathbf{k}_2) \mid \mathbf{k}_1, \mathbf{k}_2 \in F, \mathbf{k}_1 \neq \mathbf{k}_2 \}$ follows directly from (XX.1). To prove (XX.1), choose a nonzero vector $\vec{v}$ perpendicular to $\mathbf{p}$. Assume that there are distinct pairs $(\mathbf{k}_1, \mathbf{k}_2), (\mathbf{k}_3, \mathbf{k}_4), (\mathbf{k}_5, \mathbf{k}_6)$ such that $\mathbf{k}_1 - \mathbf{k}_2 = \mathbf{k}_3 - \mathbf{k}_4 = \mathbf{k}_5 - \mathbf{k}_6 = \mathbf{p}$. Without loss of generality we assume that $\mathbf{k}_1 \cdot \vec{v} < \mathbf{k}_3 \cdot \vec{v} < \mathbf{k}_5 \cdot \vec{v}$. By convexity, the parallelogram, P , with vertices $\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_5, \mathbf{k}_6$ is contained in the convex hull of F . The

segment joining $\mathbf{k}_3$ and $\mathbf{k}_4$ must cross this parallelogram. Therefore $\mathbf{k}_3$ and $\mathbf{k}_4$ lie on the edges of P . This contradicts the strict convexity of F .

Formula (XX.1) may be phrased in more geometrical terms as follows. Let s be a secant of F (that is, a straight line segment joining two different points $\mathbf{k}_1, \mathbf{k}_2 \in F$). Then there is at most one other secant s' for F that is parallel to s and has the same length. In the case that there is no second such secant, we set $s' = s$. Clearly there are $r, R > 0$ such that for all $\mathbf{k} \in F$

- i) $B_r(\mathbf{k}) \cap B_R(a(\mathbf{k})) = \emptyset$
- ii) For any secant $s \subset B_r(\mathbf{k})$ one has $s' \subset B_R(a(\mathbf{k}))$

Now consider $\epsilon_2 = +1$. If F is invariant under inversion in some point $\mathbf{p}_0 \in \mathbb{R}^2$, then, for $\mathbf{p} \neq 2\mathbf{p}_0$,

$$\#\{ (\mathbf{k}_1, \mathbf{k}_2) \in F \times F \mid \mathbf{k}_1 + \mathbf{k}_2 = \mathbf{p} \} = \#\{ (\mathbf{k}_1, \mathbf{k}'_2) \in F \times F \mid \mathbf{k}_1 + (2\mathbf{p}_0 - \mathbf{k}'_2) = \mathbf{p} \} \leq 2$$

by the case $\epsilon_2 = -1$.

Now we discuss the case that F is strongly asymmetric in the sense of Definition XVIII.3. Since $F \times F$ is compact, it suffices to show that for each point $(\mathbf{k}_1, \mathbf{k}_2) \in F \times F$ there exists a neighbourhood U of $(\mathbf{k}_1, \mathbf{k}_2)$ in $F \times F$, a subset U' of U whose complement $U \setminus U'$ has measure zero and a number m such that, for all $\mathbf{p} \in \mathbb{R}^2$,

$$\#\{ (\mathbf{q}_1, \mathbf{q}_2) \in U' \mid \mathbf{q}_1 + \mathbf{q}_2 = \mathbf{p} \} \leq m$$

If $\mathbf{k}_2 \neq \mathbf{k}_1, a(\mathbf{k}_1)$, then the map $(\mathbf{q}_1, \mathbf{q}_2) \mapsto \mathbf{q}_1 + \mathbf{q}_2$ has rank 2 at $(\mathbf{k}_1, \mathbf{k}_2)$. By the inverse function Theorem, there is a neighbourhood U of $(\mathbf{k}_1, \mathbf{k}_2)$ such that for all $\mathbf{p} \in \mathbb{R}^2$ $\#\{ (\mathbf{q}_1, \mathbf{q}_2) \in U \mid \mathbf{q}_1 + \mathbf{q}_2 = \mathbf{p} \} \leq 1$.

Next assume that $\mathbf{k}_1 = \mathbf{k}_2 = \mathbf{k}$. Let $U_r = \{ (\mathbf{q}_1, \mathbf{q}_2) \in F^2 \mid \|\mathbf{q}_1 - \mathbf{k}\|, \|\mathbf{q}_2 - \mathbf{k}\| < r \}$, where r is defined in the discussion of secants above. We claim that for $(\mathbf{q}_1, \mathbf{q}_2), (\mathbf{q}'_1, \mathbf{q}'_2) \in U_r$

$$\mathbf{q}_1 + \mathbf{q}_2 = \mathbf{q}'_1 + \mathbf{q}'_2 \iff (\mathbf{q}_1, \mathbf{q}_2) = (\mathbf{q}'_1, \mathbf{q}'_2) \text{ or } (\mathbf{q}_1, \mathbf{q}_2) = (\mathbf{q}'_2, \mathbf{q}'_1)$$

Assume that $\mathbf{q}_1 + \mathbf{q}_2 = \mathbf{q}'_1 + \mathbf{q}'_2$ and $(\mathbf{q}_1, \mathbf{q}_2) \neq (\mathbf{q}'_1, \mathbf{q}'_2), (\mathbf{q}'_2, \mathbf{q}'_1)$. Then $\mathbf{q}_1 - \mathbf{q}'_1 = \mathbf{q}'_2 - \mathbf{q}_2 \neq 0$, so that the sector s of F joining $\mathbf{q}_1$ to $\mathbf{q}'_1$ is parallel to and of the same length as, but disjoint from the sector $\tilde{s}$ joining $\mathbf{q}'_2$ to $\mathbf{q}_2$. Therefore, $\tilde{s} = s'$ where, as above, s' is the unique second secant parallel to and of the same length as s . But this is impossible, as $\tilde{s} \subset B_r(\mathbf{k})$, $s' \subset B_R(a(\mathbf{k}))$ and $B_r(\mathbf{k}) \cap B_R(a(\mathbf{k})) = \emptyset$.

Finally, assume that $\mathbf{k}_1 = \mathbf{k}$ and $\mathbf{k}_2 = a(\mathbf{k})$ for some $\mathbf{k} \in F$. We may assume, without loss of generality, that the oriented unit tangent vector to F at $\mathbf{k}$ is $(1, 0)$ and that the inward pointing unit normal vector to F at $\mathbf{k}$ is $(0, 1)$. Then in the notation of Definition XVIII.3,

$$t \mapsto \mathbf{k} + (t, \varphi_{\mathbf{k}}(t))$$

is a parametrization of F near $\mathbf{k}$ and

$$t \mapsto a(\mathbf{k}) - (t, \varphi_{a(\mathbf{k})}(t))$$

is a parametrization of F near $a(\mathbf{k})$. Then

$$(t_1, t_2) \mapsto (\mathbf{k} + (t_1, \varphi_{\mathbf{k}}(t_1)), a(\mathbf{k}) - (t_2, \varphi_{a(\mathbf{k})}(t_2)))$$

is a parametrization of $F \times F$ near $(\mathbf{k}_1, \mathbf{k}_2)$. With respect to these coordinates, the map $(\mathbf{q}_1, \mathbf{q}_2) \mapsto \mathbf{q}_1 + \mathbf{q}_2 - (\mathbf{k} + a(\mathbf{k}))$ from $F \times F$ to $\mathbb{R}^2$ is

$$\tilde{f} : (t_1, t_2) \mapsto (t_1 - t_2, \varphi_{\mathbf{k}}(t_1) - \varphi_{a(\mathbf{k})}(t_2))$$

Since F is strongly asymmetric, there is $2 \leq n \leq n_0$ such that

$$\varphi_{\mathbf{k}}^{(n)}(0) \neq \varphi_{a(\mathbf{k})}^{(n)}(0)$$

We show that, if ϵ is small enough, then, for any $\mathbf{p} = (p_1, p_2) \in \mathbb{R}^2$, the equation

$$\tilde{f}(t_1, t_2) = \mathbf{p} \quad (\text{XX.2})$$

has at most n solutions in $(-\epsilon, \epsilon)^2$. Fix $\mathbf{p}$ and set $g(t) = \varphi_{\mathbf{k}}(p_1 + t) - \varphi_{a(\mathbf{k})}(t) - p_2$. Then (t_1, t_2) is a solution of (XX.2) if and only if $(t_1, t_2) = (p_1 + t, t)$ with t a zero of $g(t)$. Hence it suffices to prove that $g(t)$ has at most n zeros. But, since $\varphi_{\mathbf{k}}^{(n)}(0) - \varphi_{a(\mathbf{k})}^{(n)}(0) \neq 0$, the n^{th} derivative $g^{(n)}(t) = \varphi_{\mathbf{k}}^{(n)}(p_1 + t) - \varphi_{a(\mathbf{k})}^{(n)}(t)$ never vanishes for $|p_1 + t|, |t| < \epsilon$, for ϵ sufficiently small. Consequently g can have at most n zeros on this set. $\blacksquare$

Lemma XX.8 *Again, assume either that F is symmetric about a point or that F is strongly asymmetric. Let $\mathbf{p} \in F$, $0 < \omega_1 < \frac{1}{2}\omega_2$ and set*

$$M = \{(\mathbf{k}_1, \mathbf{k}_2) \in F \times F \mid \min[d(\mathbf{k}_1, \mathbf{k}_2), d(a(\mathbf{k}_1), \mathbf{k}_2)] \geq \omega_1 \\ \text{and } \min[d(\mathbf{k}_i, \mathbf{p}), d(a(\mathbf{k}_i), \mathbf{p})] \leq \omega_2 \text{ for } i = 1, 2\}$$

Let $\epsilon_1, \epsilon_2 \in \{\pm 1\}$ and let f be the map from $F \times F$ to $\mathbb{R}^2$ given by

$$f(\mathbf{k}_1, \mathbf{k}_2) = \epsilon_1 \mathbf{k}_1 + \epsilon_2 \mathbf{k}_2$$

There are constants that depend only on the geometry of F such that

i) for all measurable subsets A of $\mathbb{R}^2$

$$\text{vol}(f^{-1}(A) \cap M) \leq \frac{\text{const}}{\omega_1} \text{vol}(A)$$

ii) $V_{M, \omega_1} \geq \text{const}$

iii) Let $\vec{n}$ a unit normal vector to F at $\mathbf{p}$. Then for all $(\mathbf{k}_1, \mathbf{k}_2) \in M$

$$\sup_{\substack{\vec{v} \in T_{(\mathbf{k}_1, \mathbf{k}_2)} M \\ \|\vec{v}\| \leq 1}} |\vec{n} \cdot Df(\mathbf{k}_1, \mathbf{k}_2) \vec{v}| \leq \text{const } \omega_2$$

iv) Let $0 < \epsilon < \omega_1/4$ and let Γ be an ϵ -separated subset of F . Furthermore let R be a rectangle in $\mathbb{R}^2$ having one pair of sides parallel to $\vec{n}$ of length $A > 0$ and a second pair of sides perpendicular to $\vec{n}$ of length $B > 0$. Then

$$\#f^{-1}(R) \cap M \cap \Gamma^2 \leq \frac{\text{const}}{\omega_1 \epsilon^2} (A + \epsilon \omega_2)(B + \epsilon)$$

Proof:

i) For $\mathbf{k}_1, \mathbf{k}_2 \in F$ let $\theta(\mathbf{k}_1, \mathbf{k}_2)$ be the angle between the normal vectors to F at $\mathbf{k}_1$ and at $\mathbf{k}_2$. Then the Jacobian determinant of f at $(\mathbf{k}_1, \mathbf{k}_2)$ is

$$|\sin \theta(\mathbf{k}_1, \mathbf{k}_2)| \geq \text{const} \min(d(\mathbf{k}_1, \mathbf{k}_2), d(\mathbf{k}_1, a(\mathbf{k}_2))) \geq \text{const} \omega_1$$

The claim follows from the rule for the change of variables in integrals and Lemma XX.7.

ii) is trivial.

iii) For $\mathbf{q} \in F$, let $\vartheta(\mathbf{q})$ be the angle between $\vec{n}$ and the normal vector to F at $\mathbf{q}$. Then

$$\begin{aligned} \sup_{\substack{\vec{v} \in T_{(\mathbf{k}_1, \mathbf{k}_2)} M \\ \|\vec{v}\| \leq 1}} |\vec{n} \cdot Df(\mathbf{k}_1, \mathbf{k}_2) \vec{v}| &\leq 2 \max(|\sin \vartheta(\mathbf{k}_1)|, |\sin \vartheta(\mathbf{k}_2)|) \\ &\leq \text{const} \max(\min(\|\mathbf{p} - \mathbf{k}_1\|, \|\mathbf{p} - a(\mathbf{k}_1)\|), \min(\|\mathbf{p} - \mathbf{k}_2\|, \|\mathbf{p} - a(\mathbf{k}_2)\|)) \\ &\leq \text{const} \omega_2 \end{aligned}$$

iv) Let $\vec{t}$ be the tangent vector to F at $\mathbf{p}$. Obviously

$$\sup_{\substack{\vec{v} \in T_{(\mathbf{k}_1, \mathbf{k}_2)} M \\ \|\vec{v}\| \leq 1}} |\vec{t} \cdot Df(\mathbf{k}_1, \mathbf{k}_2) \vec{v}| \leq 2$$

for all $(\mathbf{k}_1, \mathbf{k}_2) \in M$. So by parts ii and iii of this Lemma and Lemma XX.4

$$\#f^{-1}(R) \cap M \cap \Gamma^2 \leq \frac{\text{const}}{\epsilon^2} \text{vol}(f^{-1}(R'))$$

where R' is a rectangle of side lengths $A + \text{const} \epsilon \omega_2$ and $B + 4\epsilon$. By part i,

$$\text{vol}(f^{-1}(R')) \leq \frac{1}{\omega_1} (A + \text{const} \epsilon \omega_2) (B + 4\epsilon)$$

■

Sectors that are Compatible with Conservation of Momentum

Let $0 \leq \Lambda \leq \mathfrak{l}$, $\Lambda \geq \mathfrak{l}^2$, let $\mathbf{p} \in F$, $\mathbf{q} \in \mathbb{R}^2$ and let Γ be a discrete subset of F . We define for $n \geq 2$

$$\begin{aligned} Mom_{2n-1}(\Gamma, \mathbf{p}) &= \{(\mathbf{k}_1, \dots, \mathbf{k}_{2n-1}) \in \Gamma^{2n-1} \mid \exists x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i), i = 1, \dots, 2n-1 \\ &\quad \text{such that } x_1 + \dots + x_n - x_{n+1} - \dots - x_{2n-1} \in s_{\Lambda, \mathfrak{l}}(\mathbf{p})\} \\ Mom_{2n-1}^{\sim}(\Gamma, \mathbf{q}) &= \{(\mathbf{k}_1, \dots, \mathbf{k}_{2n-1}) \in \Gamma^{2n-1} \mid \exists x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i), i = 1, \dots, 2n-1 \\ &\quad \text{such that } x_1 + \dots + x_n - x_{n+1} - \dots - x_{2n-1} = \mathbf{q}\} \end{aligned}$$

Lemma XX.9 Let $\mathbf{p} \in F$, $\mathbf{q} \in \mathbb{R}^2$ and Γ an $\mathfrak{l}$ -separated subset of F .

i) If $\omega \geq \Lambda/\mathfrak{l}$ then

$$\begin{aligned} \#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid \omega \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega\} &\leq \text{const} \frac{\omega}{\mathfrak{l}} \\ \#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3^\sim(\Gamma, \mathbf{q}) \mid \omega \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega\} &\leq \text{const} \frac{\omega}{\mathfrak{l}} \end{aligned}$$

ii) If $4\mathfrak{l} \leq \omega \leq \Lambda/\mathfrak{l}$ then

$$\begin{aligned} \#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid \omega \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega\} &\leq \text{const} \frac{\Lambda}{\mathfrak{l}^2} \\ \#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3^\sim(\Gamma, \mathbf{q}) \mid \omega \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega\} &\leq \text{const} \frac{\Lambda}{\mathfrak{l}^2} \end{aligned}$$

The constants *const* above depend only on the geometry of F .

Proof: If $(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p})$ and $\max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega$, then by Proposition XX.6.ii, with $n = 2$, ω replaced by 2ω and $\mathbf{k} = \mathbf{k}_i$ or $a(\mathbf{k}_i)$, $i = 1, 2, 3$

$$\min[d(\mathbf{k}_i, \mathbf{p}), d(a(\mathbf{k}_i), \mathbf{p})] \leq 4 \text{const}_0 \omega \quad \text{for } 1 \leq i \leq 3 \quad (\text{XX.3})$$

where const_0 is the constant of Proposition XX.6. Therefore we set for $1 \leq \mu \neq \nu \leq 3$

$$\begin{aligned} \mathcal{S}_{\mu, \nu} = \{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid \omega \leq \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega \\ \max_{1 \leq \alpha \neq \beta \leq 3} \min[d(\mathbf{k}_\alpha, \mathbf{k}_\beta), d(a(\mathbf{k}_\alpha), \mathbf{k}_\beta)] \leq 2\omega \\ \text{and } \min[d(\mathbf{k}_i, \mathbf{p}), d(a(\mathbf{k}_i), \mathbf{p})] \leq 4 \text{const}_0 \omega \quad \text{for } 1 \leq i \leq 3\} \end{aligned}$$

The discussion above shows that

$$\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid \omega \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega\} \subset \bigcup_{1 \leq \mu \neq \nu \leq 3} \mathcal{S}_{\mu, \nu} \quad (\text{XX.4})$$

Similarly, if $(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3^\sim(\Gamma, \mathbf{q})$ and $\min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega$ for all $1 \leq \mu \neq \nu \leq 3$, then by Proposition XX.6.i, we have for $i = 1, 2, 3$

$$\begin{aligned} d(\mathbf{k}_i, \mathbf{p}) \leq 4 \text{const}_0 \omega \quad \text{or} \quad d(a(\mathbf{k}_i), \mathbf{p}) \leq 4 \text{const}_0 \omega \quad \text{or} \\ d(2\mathbf{k}_i - a(\mathbf{k}_i), \mathbf{p}) \leq 4 \text{const}_0 \omega \quad \text{or} \quad d(2a(\mathbf{k}_i) - \mathbf{k}_i, \mathbf{p}) \leq 4 \text{const}_0 \omega \end{aligned} \quad (\text{XX.5})$$

Setting for $1 \leq \mu \neq \nu \leq 3$

$$\begin{aligned} \mathcal{S}_{\mu, \nu}^\sim = \{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3^\sim(\Gamma, \mathbf{q}) \mid \omega \leq \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega \\ \max_{1 \leq \alpha \neq \beta \leq 3} \min[d(\mathbf{k}_\alpha, \mathbf{k}_\beta), d(a(\mathbf{k}_\alpha), \mathbf{k}_\beta)] \leq 2\omega \\ \text{and (XX.5) holds}\} \end{aligned}$$

we get

$$\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3^\sim(\Gamma, \mathbf{q}) \mid \omega \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 2\omega\} \subset \bigcup_{1 \leq \mu \neq \nu \leq 3} \mathcal{S}_{\mu, \nu}^\sim \quad (\text{XX.6})$$

We show that for $1 \leq \mu \neq \nu \leq 3$ one has $\#\mathcal{S}_{\mu, \nu}, \#\mathcal{S}_{\mu, \nu}^\sim \leq \text{const} \frac{\omega}{\mathfrak{l}}$ in case (i), and that $\#\mathcal{S}_{\mu, \nu}, \#\mathcal{S}_{\mu, \nu}^\sim \leq \text{const} \frac{\Lambda}{\mathfrak{l}^2}$ in case (ii). We only discuss the case $\mu = 1, \nu = 2$, the other cases are similar.

Set $\mathcal{S} = \mathcal{S}_{1,2}$ or $\mathcal{S} = \mathcal{S}_{1,2}^\sim$. By construction, if $(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in \mathcal{S}$,

$$\min[\|\mathbf{k}_1 - \mathbf{k}_3\|, \|\mathbf{k}_1 - a(\mathbf{k}_3)\|], \min[\|\mathbf{k}_2 - \mathbf{k}_3\|, \|\mathbf{k}_2 - a(\mathbf{k}_3)\|] \leq \text{const} \omega \quad (\text{XX.7})$$

and (XX.3) respectively (XX.5) hold for $i = 3$. Since the maps $\mathbf{k} \mapsto \mathbf{k}$, $\mathbf{k} \mapsto a(\mathbf{k})$, $\mathbf{k} \mapsto 2\mathbf{k} - a(\mathbf{k})$ and $\mathbf{k} \mapsto 2a(\mathbf{k}) - \mathbf{k}$ are embeddings of F , there are at most $\text{const} \frac{\omega}{\mathfrak{l}}$ choices of $\mathbf{k}_3 \in \Gamma$ for which (XX.3) or (XX.5) are satisfied. Fix such a $\mathbf{k}_3$. Let $\vec{\mathfrak{n}}$ be a unit normal vector to F at $\mathbf{k}_3$ and $\vec{\mathfrak{t}}$ be a unit tangent vector to F at $\mathbf{k}_3$. If $(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in \mathcal{S}$, by (XX.7), the sectors $s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i)$, $i = 1, 2, 3$ are each contained in a rectangle two of whose edges are parallel to $\vec{\mathfrak{t}}$ and have length at most $\text{const} \mathfrak{l}$, and two of whose edges are parallel to $\vec{\mathfrak{n}}$ and have length at most

$$\text{const}(\Lambda + \mathfrak{l}\omega) \leq \begin{cases} \text{const} \mathfrak{l}\omega & \text{in case (i)} \\ \text{const} \Lambda & \text{in case (ii)} \end{cases}$$

The same holds for $s_{\Lambda, \mathfrak{l}}(\mathbf{p})$ when $\mathcal{S} = \mathcal{S}_{1,2}$. In particular, if $\mathcal{S} = \mathcal{S}_{1,2}$, the set

$$\{x_3 + y \mid x_3 \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_3), y \in s_{\Lambda, \mathfrak{l}}(\mathbf{p})\}$$

is contained in a rectangle R whose one pair of edges is parallel to $\vec{\mathfrak{t}}$ and have length at most $\text{const} \mathfrak{l}$, and whose other pair of edges is parallel to $\vec{\mathfrak{n}}$ and has length at most $\text{const} \mathfrak{l}\omega$ in case (i) and length at most $\text{const} \Lambda$ in case (ii). If $\mathcal{S} = \mathcal{S}_{1,2}^\sim$, the set

$$\{x_3 + \mathbf{q} \mid x_3 \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_3)\}$$

is contained in such a rectangle R .

Let

$$\mathcal{M}(\mathbf{k}_3) = \{(\mathbf{k}_1, \mathbf{k}_2) \in \Gamma^2 \mid (\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in \mathcal{S}\}$$

By definition, if $(\mathbf{k}_1, \mathbf{k}_2) \in \mathcal{M}(\mathbf{k}_3)$, there are $x_1 \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_1)$, $x_2 \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_2)$ such that $x_1 + x_2 \in R$. The shape of $s_{\Lambda, \mathfrak{l}}(\mathbf{k}_1)$, $s_{\Lambda, \mathfrak{l}}(\mathbf{k}_2)$ and R determined above implies that the map $f : (\mathbf{k}_1, \mathbf{k}_2) \mapsto \mathbf{k}_1 + \mathbf{k}_2$ maps $\mathcal{M}(\mathbf{k}_3)$ to a rectangle R' that contains R and has one pair of edges parallel

to $\vec{t}$ and of length at most $\text{const}' \mathfrak{l}$, and a second pair of edges parallel to $\vec{n}$ and of length at most $\text{const}' \mathfrak{l} \omega$ in case (i) and $\text{const}' \Lambda$ in case (ii). Observe that

$$\mathcal{M}(\mathbf{k}_3) \subset \{(\mathbf{k}_1, \mathbf{k}_2) \in \Gamma^2 \mid \omega \leq \min[d(\mathbf{k}_1, \mathbf{k}_2), d(a(\mathbf{k}_1), \mathbf{k}_2)] \\ \text{and } \min[d(\mathbf{k}_i, \mathbf{k}_3), d(a(\mathbf{k}_i), \mathbf{k}_3)] \leq \text{const} \omega \text{ for } i = 1, 2\}$$

It follows from part iv) of Lemma XX.8, with $\mathbf{p} = \mathbf{k}_3$, $A = \text{const}' \mathfrak{l} \omega$ or $\text{const}' \Lambda$, $B = \text{const}' \mathfrak{l}$, $\omega_1 = \omega$, $\omega_2 = \text{const} \omega$ and $\epsilon = \mathfrak{l}$ that

$$\#\mathcal{M}(\mathbf{k}_3) \leq \begin{cases} \frac{\text{const}}{\omega \mathfrak{l}^2} (\mathfrak{l} \omega) (\mathfrak{l}) = \text{const} & \text{in case (i)} \\ \frac{\text{const}}{\omega \mathfrak{l}^2} \Lambda \mathfrak{l} = \text{const} \frac{\Lambda}{\omega \mathfrak{l}} & \text{in case (ii)} \end{cases}$$

Together with the observation made above, that there are at most $\text{const} \frac{\omega}{\mathfrak{l}}$ choices of $\mathbf{k}_3 \in \Gamma$ for which there exist $(\mathbf{k}_1, \mathbf{k}_2) \in \Gamma^2$ with $(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in \mathcal{S}$, this completes the proof of the Lemma. $\blacksquare$

Proposition XX.10 *For all $\mathfrak{l}$ -separated subsets Γ of F and all $\mathbf{p} \in F$, $\mathbf{q} \in \mathbb{R}^2$*

$$\#Mom_3(\Gamma, \mathbf{p}) \leq \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{\Lambda}{\mathfrak{l}} \log \frac{\Lambda}{\mathfrak{l}^2}\right) \\ \#Mom_3^\sim(\Gamma, \mathbf{q}) \leq \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{\Lambda}{\mathfrak{l}} \log \frac{\Lambda}{\mathfrak{l}^2}\right)$$

with a constant const that depends only on the geometry of F .

Proof: We give the proof for $Mom_3(\Gamma, \mathbf{p})$, the proof for $Mom_3^\sim(\Gamma, \mathbf{q})$ is similar. Applying part (i) of Lemma XX.9 successively to

$$\omega = \Lambda/\mathfrak{l}, 2\Lambda/\mathfrak{l}, 4\Lambda/\mathfrak{l}, \dots, \text{const}$$

one sees that

$$\#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \geq \Lambda/\mathfrak{l}\} \\ \leq \sum_{j=1}^{\ln_2(\text{const} \frac{1}{\Lambda})} \text{const} 2^j \frac{\Lambda}{\mathfrak{l}^2} \leq \text{const} \frac{1}{\Lambda} \frac{\Lambda}{\mathfrak{l}^2} \leq \frac{\text{const}}{\mathfrak{l}}$$

Similarly, if $4\mathfrak{l} \leq \frac{\Lambda}{\mathfrak{l}}$ and one applies part (ii) of Lemma XX.9 successively to

$$\omega = 4\mathfrak{l}, 8\mathfrak{l}, 16\mathfrak{l}, \dots, 2^{1+\lceil \log_2 \frac{\Lambda}{\mathfrak{l}^2} \rceil} \mathfrak{l}$$

one sees that

$$\#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid 4\mathfrak{l} \leq \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq \Lambda/\mathfrak{l}\} \\ \leq \frac{\text{const} \Lambda}{\mathfrak{l}^2} (1 + \log_2 \frac{\Lambda}{\mathfrak{l}^2})$$

Finally, it is obvious that

$$\#\{(\mathbf{k}_1, \mathbf{k}_2, \mathbf{k}_3) \in Mom_3(\Gamma, \mathbf{p}) \mid \max_{1 \leq \mu \neq \nu \leq 3} \min[d(\mathbf{k}_\mu, \mathbf{k}_\nu), d(a(\mathbf{k}_\mu), \mathbf{k}_\nu)] \leq 4\mathfrak{l}\} \leq \frac{\text{const}}{\mathfrak{l}}$$

$\blacksquare$

Proposition XX.11 *Let $n \geq 2$, $\delta \geq \mathfrak{l}$ and let $I_1, \dots, I_{2n-1}$ be intervals of length δ in F . Assume that*

$$\frac{1}{3}\omega = \max_{1 \leq i \neq j \leq 2n-1} \min \left(\text{dist}(I_i, I_j), \text{dist}(I_i, a(I_j)) \right) > \max(\delta, 4\mathfrak{l})$$

Then for all $\mathfrak{l}$ -separated subsets Γ of F , all $\mathbf{p} \in F$ and all $\mathbf{q} \in \mathbb{R}^2$

$$\begin{aligned} \#Mom_{2n-1}(\Gamma, \mathbf{p}) \cap (I_1 \times \dots \times I_{2n-1}) &\leq \text{const } n^2 \left(\frac{\delta}{\mathfrak{l}} + 1 \right)^{2n-3} \left(1 + \frac{\Lambda}{\mathfrak{l}\omega} \right) \\ \#Mom_{2n-1}^{\sim}(\Gamma, \mathbf{q}) \cap (I_1 \times \dots \times I_{2n-1}) &\leq \text{const } n^2 \left(\frac{\delta}{\mathfrak{l}} + 1 \right)^{2n-3} \left(1 + \frac{\Lambda}{\mathfrak{l}\omega} \right) \end{aligned}$$

with a constant const that depends only on the geometry of F .

Proof: The proof is similar to the proof of Proposition XX.10. Set

$$\epsilon_i = \begin{cases} +1 & \text{for } 1 \leq i \leq n \\ -1 & \text{for } n+1 \leq i \leq 2n-1 \end{cases}$$

Choose a point $\mathbf{k} \in I_1$. Then for all $x \in \bigcup_{i=1}^{2n-1} I_i$

$$d(x, \mathbf{k}) \leq \omega \quad \text{or} \quad d(x, a(\mathbf{k})) \leq \omega$$

Choose $1 \leq i_0 < j_0 \leq 2n-1$ such that

$$\min \left(\text{dist}(I_{i_0}, I_{j_0}), \text{dist}(I_{i_0}, a(I_{j_0})) \right) = \frac{1}{3}\omega$$

Since Γ is $\mathfrak{l}$ -separated and each I_j is of length δ ,

$$\# \prod_{\substack{i=1 \\ i \neq i_0, j_0}}^{2n-1} \Gamma \cap I_i \leq \left(\frac{\delta}{\mathfrak{l}} + 1 \right)^{2n-3} \quad (\text{XX.8})$$

Fix $\mathbf{k}_i \in \Gamma \cap I_i$ for $i = 1, \dots, 2n-1$, $i \neq i_0, j_0$. Let $\vec{\mathbf{n}}$ be a unit normal vector to F at $\mathbf{k}$ and $\vec{\mathbf{t}}$ be a unit tangent vector to F at $\mathbf{k}$.

By Proposition XX.5

$$-\left\{ \sum_{\substack{i=1 \\ i \neq i_0, j_0}}^{2n-1} \epsilon_i x_i - \mathbf{q} \mid x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i) \right\}$$

is contained in a rectangle $R^{\sim}$ having one pair of edges parallel to $\vec{\mathbf{t}}$ and of length at most $\text{const } n \mathfrak{l}$ and a second pair of edges parallel to $\vec{\mathbf{n}}$ and of length at most $\text{const } n [\Lambda + \mathfrak{l}\omega]$. As each $s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i)$ is contained in a rectangle having one pair of edges parallel to $\vec{\mathbf{t}}$ and of length

at most $\text{const } \mathfrak{l}$ and a second pair of edges parallel to $\vec{n}$ and of length at most $\text{const } [\Lambda + \mathfrak{l}\omega]$, the map $f : (\mathbf{k}_{i_0}, \mathbf{k}_{j_0}) \mapsto \epsilon_{i_0} \mathbf{k}_{i_0} + \epsilon_{j_0} \mathbf{k}_{j_0}$ maps the set

$$\begin{aligned} \mathcal{M}^\sim &= \{(\mathbf{k}_{i_0}, \mathbf{k}_{j_0}) \in \Gamma^2 \cap (I_{i_0} \times I_{j_0}) \mid \exists x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i), i = 1, \dots, 2n-1 \\ &\quad \text{such that } x_1 + \dots + x_n - x_{n+1} - \dots - x_{2n-1} = \mathbf{q}\} \end{aligned}$$

to a rectangle R' having one pair of edges parallel to $\vec{t}$ and of length at most $B = n \text{const}' \mathfrak{l}$, and a second pair of edges parallel to $\vec{n}$ and of length at most

$$A = \text{const}' n [\Lambda + \mathfrak{l}\omega]$$

By part iv of Lemma XX.8, with $\mathbf{p}$ replaced by $\mathbf{k}$, $\omega_1 = \frac{1}{3}\omega$, $\omega_2 = \omega$ and $\epsilon = \mathfrak{l}$

$$\#\mathcal{M}^\sim \leq \frac{\text{const}}{\mathfrak{l}^2 \omega} (n\Lambda + n\mathfrak{l}\omega)(n\mathfrak{l}) \leq \text{const } n^2 \left(1 + \frac{\Lambda}{\mathfrak{l}\omega}\right)$$

This, together with (XX.8), proves

$$\#Mom_{2n-1}^\sim(\Gamma, \mathbf{q}) \cap (I_1 \times \dots \times I_{2n-1}) \leq \text{const } \left(\frac{\delta}{\mathfrak{l}} + 1\right)^{2n-3} n^2 \left(1 + \frac{\Lambda}{\mathfrak{l}\omega}\right)$$

By Proposition XX.6.ii

$$\|\mathbf{p} - \mathbf{k}\| \leq \text{const } n \omega \quad \text{or} \quad \|\mathbf{p} - a(\mathbf{k})\| \leq \text{const } n \omega$$

Therefore $s_{\Lambda, \mathfrak{l}}(\mathbf{p})$ is contained in a rectangle, two of whose edges are parallel to $\vec{t}$ and have length at most $\text{const } \mathfrak{l}$ and two of whose edges are parallel to $\vec{n}$ and have length at most

$$\text{const } (\Lambda + \mathfrak{l}\|\mathbf{p} - \mathbf{k}\|) \leq \text{const } (\Lambda + n \mathfrak{l}\omega)$$

This, and Proposition XX.5 imply that

$$-\left\{ \sum_{\substack{i=1 \\ i \neq i_0, j_0}}^{2n-1} \epsilon_i x_i - y \mid x_i \in s_{\Lambda, \mathfrak{l}}(\mathbf{k}_i), y \in s_{\Lambda, \mathfrak{l}}(\mathbf{p}) \right\}$$

is contained in a rectangle R having one pair of edges parallel to $\vec{t}$ and of length at most $\text{const } n \mathfrak{l}$ and a second other pair of edges parallel to $\vec{n}$ and of length at most

$$\text{const } [n\Lambda + n \mathfrak{l}\omega + n \mathfrak{l}\omega] \leq \text{const } n [\Lambda + \mathfrak{l}\omega]$$

As above, this implies that

$$\#Mom_{2n-1}(\Gamma, \mathbf{p}) \cap (I_1 \times \dots \times I_{2n-1}) \leq \text{const } \left(\frac{\delta}{\mathfrak{l}} + 1\right)^{2n-3} n^2 \left(1 + \frac{\Lambda}{\mathfrak{l}\omega}\right)$$

■

XXI. Sectors Compatible with Conservation of Momentum

Comparison of the 1–norm and the 3–norm for Four–legged Kernels

Lemma XXI.1 *There is a constant const independent of M such that the following holds. Let Σ be a sectorization of length $\mathfrak{l}$ at scale j with $\frac{2}{M^{j-1}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$. Furthermore let $\varphi \in \mathcal{F}_0(4; \Sigma)$ and $f \in \tilde{\mathcal{F}}_1(3; \Sigma)$ be particle number conserving functions. Then*

$$\begin{aligned} |\varphi|_{1, \Sigma} &\leq \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{1}{\mathfrak{l}M^{j-1}} \log \frac{1}{\mathfrak{l}^2 M^{j-1}}\right) |\varphi|_{3, \Sigma} \\ |f|_{1, \Sigma} &\leq \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{1}{\mathfrak{l}M^{j-1}} \log \frac{1}{\mathfrak{l}^2 M^{j-1}}\right) |f|_{3, \Sigma} \end{aligned}$$

Proof: By Definition XII.9 of [FKTo3] and Remark XX.2.i

$$|\varphi|_{1, \Sigma} = \max_{1 \leq i_1 \leq 4} \max_{s_{i_1} \in \Sigma} \sum_{\substack{s_i \in \Sigma \text{ for } i \neq i_1 \\ s_1, s_2, s_3, s_4 \text{ compatible with} \\ \text{conservation of momentum}}} \|\varphi((\cdot, s_1), \dots, (\cdot, s_4))\|_{1, \infty}$$

Let $1 \leq i_1 \leq 4$ and $s_{i_1} \in \Sigma$. Choose i_2, i_3, i_4 such that $\{1, 2, 3, 4\} = \{i_1, i_2, i_3, i_4\}$. By Remark XX.2.ii and Proposition XX.10, with $\Lambda = \frac{\sqrt{2}}{M^{j-1}}$, there are at most $\frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{M}{\mathfrak{l}M^j} \log \frac{M}{\mathfrak{l}^2 M^j}\right)$ triples $(s_{i_2}, s_{i_3}, s_{i_4})$ such that (s_1, s_2, s_3, s_4) is compatible with conservation of momentum. Consequently

$$\begin{aligned} |\varphi|_{1, \Sigma} &\leq \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{M}{\mathfrak{l}M^j} \log \frac{M}{\mathfrak{l}^2 M^j}\right) \max_{s_1, s_2, s_3, s_4 \in \Sigma} \|\varphi((\cdot, s_1), \dots, (\cdot, s_4))\|_{1, \infty} \\ &\leq \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{1}{\mathfrak{l}M^{j-1}} \log \frac{1}{\mathfrak{l}^2 M^{j-1}}\right) \max_{\substack{1 \leq i_1 < i_2 < i_3 \leq 4 \\ s_{i_1}, s_{i_2}, s_{i_3} \in \Sigma}} \sum_{\substack{s_i \in \Sigma \\ \text{for } i \neq i_1, i_2, i_3}} \|\varphi((\cdot, s_1), \dots, (\cdot, s_4))\|_{1, \infty} \\ &= \frac{\text{const}}{\mathfrak{l}} \left(1 + \frac{1}{\mathfrak{l}M^{j-1}} \log \frac{1}{\mathfrak{l}^2 M^{j-1}}\right) |\varphi|_{3, \Sigma} \end{aligned}$$

The argument for $|f|_{1, \Sigma}$ is analogous. ■

Proof of Proposition XIX.1: Under the hypotheses of this Proposition, the term $\frac{1}{\mathfrak{l}M^{j-1}} \log \frac{1}{\mathfrak{l}^2 M^{j-1}}$ is bounded by an M –independent constant and the first inequality, $|\varphi|_{1, \Sigma} \leq \text{const} \frac{1}{\mathfrak{l}} |\varphi|_{3, \Sigma}$, follows. If $f \in \tilde{\mathcal{F}}_{4; \Sigma}$ and $\vec{i} \in \{0, 1\}^4$, then $|f|_{\vec{i}}|_{1, \Sigma} = 0$ unless $m(\vec{i}) \leq 1$. Therefore the second inequality, $|f|_{1, \Sigma} \leq \text{const} \frac{1}{\mathfrak{l}} |f|_{3, \Sigma}$, also follows from Lemma XXI.1. ■

Auxiliary Norms

Let Σ be a sectorization of scale j and length $\mathfrak{l} \geq \frac{1}{M^{j-1}}$. For $\omega > 0$ we define auxiliary norms on functions φ in $\mathcal{F}_0(n; \Sigma)$ and $f \in \mathcal{F}_1(n; \Sigma)$ that are antisymmetric in their

(ξ, s) arguments by

$$|\varphi|_{1,\Sigma,\omega} = \max_{s_1 \in \Sigma} \sum_{\substack{s_2, \dots, s_n \in \Sigma \\ \text{dist}(s_k, s_\ell) \geq \omega \text{ and} \\ \text{dist}(s_k, a(s_\ell)) \geq \omega \\ \text{for some } 2 \leq k \neq \ell \leq n}} \|\varphi((\cdot, s_1), \dots, (\cdot s_n))\|_{1,\infty}$$

$$|f|_{1,\Sigma,\omega}^{\sim} = \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\tilde{\eta} \in \mathcal{B}} \sum_{\substack{s_1, \dots, s_n \in \Sigma \\ \text{dist}(s_k, s_\ell) \geq \omega \text{ and} \\ \text{dist}(s_k, a(s_\ell)) \geq \omega \\ \text{for some } 1 \leq k \neq \ell \leq n}} \max_{\substack{\text{Ddd-operator} \\ \text{with } \delta(D) = \delta}} \left\| \text{D}f(\tilde{\eta}; (\xi_1, s_1), \dots, (\xi_n, s_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!}$$

The norm $\|\cdot\|_{1,\infty}$ of Example II.6 refers to the variables $\xi_1, \dots, \xi_n$. Furthermore, maxima, like $\max_{s_1 \in \Sigma}$, that act on a formal power series $\sum_\delta a_\delta t^\delta$ are to be applied separately to each coefficient a_δ .

Lemma XXI.2 *Let $\omega \geq \max\{1, \frac{1}{M^{(j-1)/2}}\}$, $n \geq 3$ and let $\varphi \in \mathcal{F}_0(n; \Sigma)$ and $f \in \mathcal{F}_1(n; \Sigma)$ be particle number conserving functions that are antisymmetric in their (ξ, s) arguments. Then*

$$|\varphi|_{1,\Sigma} \leq |\varphi|_{1,\Sigma,\omega} + \text{const } n \frac{\omega^2}{1^2} |\varphi|_{3,\Sigma}$$

$$|f|_{1,\Sigma}^{\sim} \leq |f|_{1,\Sigma,\omega}^{\sim} + \text{const } n^2 \frac{\omega^2}{1^2} |f|_{3,\Sigma}^{\sim}$$

Proof: By definition of $|\varphi|_{1,\Sigma}$ and the antisymmetry of φ

$$|\varphi|_{1,\Sigma} \leq |\varphi|_{1,\Sigma,\omega} + \max_{s_1 \in \Sigma} \sum_{\substack{s_2, \dots, s_n \in \Sigma \\ \text{dist}(s_k, s_\ell) \leq \omega \text{ or} \\ \text{dist}(s_k, a(s_\ell)) \leq \omega \\ \text{for all } 2 \leq k \neq \ell \leq n}} \|\varphi((\cdot, s_1), \dots, (\cdot s_n))\|_{1,\infty}$$

Fix $s_1 \in \Sigma$. If $s_2, \dots, s_n \in \Sigma$ are such that for all $2 \leq k \neq \ell \leq n$ one has $\text{dist}(s_k, s_\ell) \leq \omega$ or $\text{dist}(s_k, a(s_\ell)) \leq \omega$ and such that $s_1, \dots, s_n$ are compatible with conservation of momentum for some choice of annihilation/creation indices $(b_1, \dots, b_n)$, then, by Proposition XX.6.ii with $\Lambda = \frac{\sqrt{2}}{M^{j-1}}$, $\mathbf{p}$ the center of s_1 and $\mathbf{k}$ the center of s_2 ,

$$\text{dist}(s_1, s_k) \leq \text{const } n \omega \quad \text{or} \quad \text{dist}(s_1, a(s_k)) \leq \text{const } n \omega$$

for $2 \leq k \leq n$. Set

$$\text{Sect} = \{(s_2, s_3) \in \Sigma^2 \mid \text{dist}(s_1, s_2) \leq \text{const } n \omega \text{ or } \text{dist}(s_1, a(s_2)) \leq \text{const } n \omega \\ \text{and } \text{dist}(s_2, s_3) \leq \text{const } \omega \text{ or } \text{dist}(s_2, a(s_3)) \leq \text{const } \omega\}$$

Clearly $|\text{Sect}| \leq \text{const } n \frac{\omega^2}{1^2}$. Consequently

$$\sum_{\substack{s_2, \dots, s_n \in \Sigma \\ \text{dist}(s_k, s_\ell) \leq \omega \text{ or} \\ \text{dist}(s_k, a(s_\ell)) \leq \omega \\ \text{for all } 2 \leq k \neq \ell \leq n}} \|\varphi((\cdot, s_1), \dots, (\cdot s_n))\|_{1,\infty} \leq \sum_{s_2, s_3 \in \text{Sect}} \sum_{s_4, \dots, s_n \in \Sigma} \|\varphi((\cdot, s_1), \dots, (\cdot s_n))\|_{1,\infty}$$

$$\leq \text{const } n \frac{\omega^2}{1^2} |\varphi|_{3,\Sigma}$$

Similarly,

$$|f|_{1,\Sigma}^{\sim} \leq |f|_{1,\Sigma,\omega}^{\sim} + \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \max_{\tilde{\eta} \in \tilde{\mathcal{B}}} \sum_{\substack{s_1, \dots, s_n \in \Sigma \\ \text{dist}(s_k, s_\ell) \leq \omega \text{ or} \\ \text{dist}(s_k, a(s_\ell)) \leq \omega \\ \text{for all } 1 \leq k \neq \ell \leq n}} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \|Df(\tilde{\eta}; (\xi_1, s_1), \dots, (\xi_n, s_n))\|_{1,\infty} \frac{t^\delta}{\delta!}$$

Fix $\tilde{\eta} = (p_0, \mathbf{p}, \sigma, b) \in \tilde{\mathcal{B}}$. If $s_1, \dots, s_n \in \Sigma$ are such that for all $1 \leq k \neq \ell \leq n$ one has $\text{dist}(s_k, s_\ell) \leq \omega$ or $\text{dist}(s_k, a(s_\ell)) \leq \omega$ and such that the configuration $(\tilde{\eta}; s_1, \dots, s_n)$ is compatible with conservation of momentum, then, by Proposition XX.6.i with $\Lambda = \frac{\sqrt{2}}{M^{j-1}}$ and $\mathbf{k}$ the center of s_1 , there is an integer r with $|r| \leq n$ such that

$$\|\mathbf{p} - r\mathbf{k} + (r-1)a(\mathbf{k})\| \leq \text{const } n \omega \quad (\text{XXI.1})$$

The maps $F \longrightarrow \mathbb{R}^2$, $\mathbf{k} \mapsto r\mathbf{k} - (r-1)a(\mathbf{k})$ are embeddings. Therefore there are at most $\text{const } n\omega/\mathfrak{l}$ sectors s_1 containing a $\mathbf{k}$ such that (XXI.1) holds. Set

$$\text{Sect} = \left\{ (s_1, s_2) \in \Sigma^2 \mid s_1 \text{ contains a point } \mathbf{k} \text{ for which (XXI.1) holds with some } |r| \leq n \right. \\ \left. \text{and } \text{dist}(s_1, s_2) \leq \text{const } \omega \text{ or } \text{dist}(s_1, a(s_2)) \leq \text{const } \omega \right\}$$

Again $|\text{Sect}| \leq \text{const } n^2 \frac{\omega^2}{\mathfrak{l}^2}$. Consequently

$$\begin{aligned} & \sum_{\substack{s_1, \dots, s_n \in \Sigma \\ \text{dist}(s_k, s_\ell) \leq \omega \text{ or} \\ \text{dist}(s_k, a(s_\ell)) \leq \omega \\ \text{for all } 1 \leq k \neq \ell \leq n}} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \|Df(\tilde{\eta}; (\xi_1, s_1), \dots, (\xi_n, s_n))\|_{1,\infty} t^\delta \\ & \leq \sum_{s_1, s_2 \in \text{Sect}} \sum_{s_3, \dots, s_n \in \Sigma} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \|Df(\tilde{\eta}; (\xi_1, s_1), \dots, (\xi_n, s_n))\|_{1,\infty} t^\delta \\ & \leq \text{const } n^2 \frac{\omega^2}{\mathfrak{l}^2} |f|_{3,\Sigma}^{\sim} \end{aligned}$$

■

Change of Sectorization

To prepare for the proof of Proposition XIX.4, we note

Lemma XXI.3 *Let $j > i \geq 2$, $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$ and $\frac{1}{M^{i-3/2}} \leq \mathfrak{l}' \leq \frac{1}{M^{(i-1)/2}}$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length $\mathfrak{l}'$ at scale i , respectively. Suppose that $\mathfrak{l} < \mathfrak{l}'$. Let $\varphi \in \mathcal{F}_m(n; \Sigma')$ and $f \in \tilde{\mathcal{F}}_m(n; \Sigma')$ be particle number conserving.*

i) For $s_1, \dots, s_n \in \Sigma$

$$\|\varphi_\Sigma(\eta_1, \dots, \eta_m; (\xi_1, s_1), \dots, (\xi_n, s_n))\|_{1,\infty} \leq \text{const}^n \mathfrak{c}_{j-1} \sum_{\substack{s'_1, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset}} \|\varphi(\eta_1, \dots, \eta_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n))\|_{1,\infty}$$

and for $\check{\eta}_1, \dots, \check{\eta}_m \in \check{\mathcal{B}}$ and $s_1, \dots, s_n \in \Sigma$

$$\begin{aligned} & \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f_{\Sigma}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi_1, s_1), \dots, (\xi_n, s_n)) \right\|_{1, \infty} t^{\delta} \\ & \leq \text{const}^n \mathbf{c}_{j-1} \sum_{\substack{s'_1, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset}} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f(\check{\eta}_1, \dots, \check{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n)) \right\|_{1, \infty} t^{\delta} \end{aligned}$$

ii) If f is antisymmetric in its (ξ, s) arguments

$$|f_{\Sigma}|_{p, \Sigma}^{\sim} \leq \text{const}^n \mathbf{c}_{j-1} |f|_{p, \Sigma'}^{\sim} \sup_{\check{\eta}_1, \dots, \check{\eta}_m \in \check{\mathcal{B}}_m} \max_{\substack{s_1, \dots, s_{p-m} \in \Sigma \\ s'_{p-m+1}, \dots, s'_n \in \Sigma'}} \# \text{Cons}(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_{p-m}; s'_{p-m+1}, \dots, s'_n)$$

where $\text{Cons}(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_{p-m}; s'_{p-m+1}, \dots, s'_n)$ denotes the set of all $(s_{p-m+1}, \dots, s_n) \in \Sigma^{m+n-p}$ such that $\tilde{s}_i \cap \tilde{s}'_i \neq \emptyset$ for $i = p-m+1, \dots, n$ and the configuration $(\check{\eta}_1, \dots, \check{\eta}_m; s_1, \dots, s_n)$ is consistent with conservation of momentum in the sense of Definition XX.1.

iii) If $m = 0$, $\omega \geq \mathbf{l}'$ and φ is antisymmetric, then

$$|\varphi_{\Sigma}|_{1, \Sigma, \omega} \leq \text{const}^n \mathbf{c}_{j-1} |\varphi|_{1, \Sigma'} \max_{s_1 \in \Sigma} \max_{\substack{s'_2, \dots, s'_n \in \Sigma' \\ \text{dist}(s'_k, s'_\ell) \geq \omega - 2\mathbf{l}' \text{ and} \\ \text{dist}(s'_k, a(s'_\ell)) \geq \omega - 2\alpha \mathbf{l}' \\ \text{for some } 2 \leq k \neq \ell \leq n}} \# \text{Cons}(s_1; s'_2, \dots, s'_n)$$

Here, α is the supremum of the derivative of the antipodal map a on the Fermi curve F . If $m = 1$, $\omega \geq \mathbf{l}'$ and f is antisymmetric in its (ξ, s) arguments, then

$$|f_{\Sigma}|_{1, \Sigma, \omega}^{\sim} \leq \text{const}^n \mathbf{c}_{j-1} |f|_{1, \Sigma'}^{\sim} \sup_{\check{\eta} \in \check{\mathcal{B}}} \max_{\substack{s'_1, \dots, s'_n \in \Sigma' \\ \text{dist}(s'_k, s'_\ell) \geq \omega - 2\mathbf{l}' \text{ and} \\ \text{dist}(s'_k, a(s'_\ell)) \geq \omega - 2\alpha \mathbf{l}' \\ \text{for some } 1 \leq k \neq \ell \leq n}} \# \text{Cons}(\check{\eta}; s'_1, \dots, s'_n)$$

Proof: i)

$$\varphi_{\Sigma}(\eta_1, \dots, \eta_m; (\xi_1, s_1), \dots, (\xi_n, s_n)) = \sum_{\substack{s'_1, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset}} \int d\xi'_1 \dots d\xi'_n \varphi(\eta_1, \dots, \eta_m; (\xi'_1, s'_1), \dots, (\xi'_n, s'_n)) \prod_{\ell=1}^n \hat{\chi}_{s_\ell}(\xi'_\ell, \xi_\ell)$$

Hence, by Lemma II.7 of [FKTo1] and Lemma XII.3 of [FKTo3],

$$\left\| \varphi_{\Sigma}(\eta_1, \dots, \eta_m; (\xi_1, s_1), \dots, (\xi_n, s_n)) \right\|_{1, \infty} \leq \text{const}^n \mathbf{c}_{j-1}^n \sum_{\substack{s'_1, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset}} \left\| \varphi(\eta_1, \dots, \eta_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n)) \right\|_{1, \infty}$$

The proof of the second inequality is similar.

ii) By part (i) and Remark XX.2.i

$$\begin{aligned}
|f_\Sigma|_{p,\Sigma} &\leq \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{s_1, \dots, s_{p-m} \in \Sigma \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}_m}} \sum_{s_{p-m+1}, \dots, s_n \in \Sigma} \\
&\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f_\Sigma(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\cdot, s_1), \dots, (\cdot, s_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \\
&\leq \text{const}^n \mathfrak{c}_{j-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{s_1, \dots, s_{p-m} \in \Sigma \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}_m}} \sum_{s_{p-m+1}, \dots, s_n \in \Sigma} \sum_{\substack{s'_1, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset}} \\
&\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\cdot, s'_1), \dots, (\cdot, s'_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \\
&= \text{const}^n \mathfrak{c}_{j-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{s_1, \dots, s_{p-m} \in \Sigma \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}_m}} \sum_{\substack{s'_1, \dots, s'_{p-m} \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset \\ i=1, \dots, p-m}} \sum_{\substack{s'_{p-m+1}, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset \\ i=p-m+1, \dots, n}} \sum_{s_{p-m+1}, \dots, s_n \in \Sigma} \\
&\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\cdot, s'_1), \dots, (\cdot, s'_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \\
&\leq \text{const}^n \mathfrak{c}_{j-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{s_1, \dots, s_{p-m} \in \Sigma \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}_m}} \sum_{\substack{s'_1, \dots, s'_{p-m} \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset \\ i=1, \dots, p-m}} \sum_{s'_{p-m+1}, \dots, s'_n \in \Sigma'} \# \text{Cons}(\tilde{\eta}_1, \dots, \tilde{\eta}_m; s_1, \dots, s_{p-m}; s'_{p-m+1}, \dots, s'_n) \\
&\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\cdot, s'_1), \dots, (\cdot, s'_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \\
&\leq \text{const}^n \mathfrak{c}_{j-1} |f|_{p,\Sigma'} \sup_{\tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}_m} \max_{\substack{s_1, \dots, s_{p-m} \in \Sigma \\ s'_{p-m+1}, \dots, s'_n \in \Sigma'}} \# \text{Cons}(\tilde{\eta}_1, \dots, \tilde{\eta}_m; s_1, \dots, s_{p-m}; s'_{p-m+1}, \dots, s'_n)
\end{aligned}$$

since, for $i = 1, \dots, p-m$, there are at most three sectors $s'_i \in \Sigma'$ with $\tilde{s}'_i \cap \tilde{s}_i \neq \emptyset$.

iii) If $s_k, s_\ell \in \Sigma$ with $\text{dist}(s_k, s_\ell) \geq \omega$, $\text{dist}(s_k, a(s_\ell)) \geq \omega$ and $s'_k, s'_\ell \in \Sigma'$ with $\tilde{s}_k \cap \tilde{s}'_k \neq \emptyset$, $\tilde{s}_\ell \cap \tilde{s}'_\ell \neq \emptyset$ then $\text{dist}(s'_k, s'_\ell) \geq \omega - 2\ell'$ and $\text{dist}(s'_k, a(s'_\ell)) \geq \omega - 2\alpha\ell'$. Using this observation, the proof of (iii) is analogous to the proof of (ii). $\blacksquare$

Lemma XXI.4 *Let $j > i \geq 2$, $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$ and $\frac{1}{M^{i-3/2}} \leq \ell' \leq \frac{1}{M^{(i-1)/2}}$ with $\mathfrak{l} < \frac{1}{4}\ell'$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length ℓ' at scale i , respectively.*

i) *There is a constant const independent of M such that for every $s' \in \Sigma'$*

$$\#\{s \in \Sigma \mid \tilde{s} \cap \tilde{s}' \neq \emptyset\} \leq \text{const} \frac{\ell'}{\mathfrak{l}}$$

ii) *Let $m \geq 0$, $p \geq m$, $n \geq p-m+1$, $\tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}$, $s_1, \dots, s_{p-m} \in \Sigma$ and $s'_{p-m+1}, \dots, s'_n \in \Sigma'$. Then*

$$\# \text{Cons}(\tilde{\eta}_1, \dots, \tilde{\eta}_m; s_1, \dots, s_{p-m}; s'_{p-m+1}, \dots, s'_n) \leq \text{const}^n \left(\frac{\ell'}{\mathfrak{l}}\right)^{n+m-p-1}$$

iii) Let $\omega' \geq 4\mathfrak{l}'$, and let $s_1 \in \Sigma$ and $s'_2, \dots, s'_n \in \Sigma'$ such that $\text{dist}(s'_k, s'_\ell) \geq \omega'$ and $\text{dist}(s'_k, a(s'_\ell)) \geq \omega'$ for some $2 \leq k \neq \ell \leq n$. Then

$$\#\text{Cons}(s_1; s'_2, \dots, s'_n) \leq \text{const}^n \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n-3} \left(1 + \frac{1}{M^{j-1}\mathfrak{l}\omega'}\right)$$

iv) Let $\omega' \geq 4\mathfrak{l}'$, $\check{\eta} = (q_o, \mathbf{q}, \sigma, a) \in \check{B}$ and $s'_1, \dots, s'_n \in \Sigma'$ such that $\text{dist}(s'_k, s'_\ell) \geq \omega'$ and $\text{dist}(s'_k, a(s'_\ell)) \geq \omega'$ for some $1 \leq k \neq \ell \leq n$. Then

$$\#\text{Cons}(\check{\eta}; s'_1, \dots, s'_n) \leq \text{const}^n \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n-2} \left(1 + \frac{1}{M^{j-1}\mathfrak{l}\omega'}\right)$$

Proof: i) is trivial

ii) By part (i), there are at most $\text{const}^n \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-p-1}$ $(n+m-p-1)$ -tuples $(s_{p-m+1}, \dots, s_{n-1})$ of sectors in Σ such that $\tilde{s}_i \cap \tilde{s}'_i \neq \emptyset$ for $i = p-m+1, \dots, n-1$. Given such an $(n+m-p-1)$ -tuple $(s_{p-m+1}, \dots, s_{n-1})$ and a particle number preserving sequence $(a_1, \dots, a_n)$ of creation-annihilation indices, the set

$$\{ -(-1)^{a_n} (\check{\eta}_1 + \dots + \check{\eta}_m + (-1)^{a_1} \mathbf{k}_1 + \dots + (-1)^{a_{n-1}} \mathbf{k}_{n-1}) \mid \mathbf{k}_i \in \tilde{s}_i \text{ for } i = 1, \dots, n-1 \}$$

has diameter at most $\text{const} (n-1) \mathfrak{l}$ and therefore meets at most $\text{const} (n-1)$ extended sectors of Σ . This shows that there are at most const^n sectors $s_n \in \Sigma$ such that $(s_1, \dots, s_n)$ is consistent with conservation of momentum.

iii) Let $(a_1, \dots, a_n)$ be a particle number preserving sequence of creation-annihilation indices. For $i = 1, \dots, n-1$ let $I_i = \{ \mathbf{k} \in F \mid \text{dist}(\mathbf{k}, s'_{i+1}) \leq \mathfrak{l} \}$. We apply the first inequality of Proposition XX.11 with $\delta = \mathfrak{l}' + 2\mathfrak{l}$, $\Lambda = \frac{\sqrt{2}}{M^{j-1}}$, Γ the set of centers of the intervals $s \cap F$, $s \in \Sigma$ and $\mathbf{p}$ the center of $s_1 \cap F$. It follows that

$$\#\text{Cons}(s_1; s'_2, \dots, s'_n) \leq \text{const}^n \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n-3} \left(1 + \frac{1}{M^{j-1}\mathfrak{l}\omega'}\right)$$

iv) is similar to (iii), using the second inequality of Proposition XX.11 instead. ■

Proof of Proposition XIX.4: i) As $m \neq 0$, by Lemma XXI.3.i and Lemma XXI.4.i

$$\begin{aligned} |\varphi_\Sigma|_{1,\Sigma} &= \sum_{s_1, \dots, s_n \in \Sigma} \|\varphi_\Sigma(\eta_1, \dots, \eta_m; (\xi_1, s_1), \dots, (\xi_n, s_n))\|_{1,\infty} \\ &\leq \text{const}^n \mathfrak{c}_{j-1} \sum_{\substack{s_1, \dots, s_n \in \Sigma \\ s'_1, \dots, s'_n \in \Sigma' \\ \tilde{s}'_i \cap \tilde{s}_i \neq \emptyset}} \|\varphi(\eta_1, \dots, \eta_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n))\|_{1,\infty} \\ &\leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^n \sum_{s'_1, \dots, s'_n \in \Sigma'} \|\varphi(\eta_1, \dots, \eta_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n))\|_{1,\infty} \\ &= \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^n |\varphi|_{1,\Sigma'} \end{aligned}$$

ii) By Lemma XXI.3.ii and Lemma XXI.4.ii

$$|f_\Sigma|_{p,\Sigma}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-p-1} |f|_{p,\Sigma'}^\sim \quad (\text{XXI.2})$$

Now assume that $\mathfrak{l} \geq \frac{1}{M^{2/3(j-1)}}$, $\mathfrak{l}' \leq \frac{1}{16}$ and $n \geq 3$. Observe that $|f_\Sigma|_{1,\Sigma}^\sim$ vanishes for $m \geq 2$, so it suffices to consider $m = 0, 1$. Set $\omega = \alpha\sqrt{\mathfrak{l}}$. By Lemma XXI.2

$$|f_\Sigma|_{1,\Sigma}^\sim \leq |f_\Sigma|_{1,\Sigma,\omega}^\sim + \text{const} n^2 \frac{\omega^2}{\mathfrak{l}^2} |f_\Sigma|_{3,\Sigma}^\sim$$

By (XXI.2),

$$\begin{aligned} n^2 \frac{\omega^2}{\mathfrak{l}^2} |f_\Sigma|_{3,\Sigma}^\sim &\leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-4} \frac{\omega^2}{\mathfrak{l}^2} |f|_{3,\Sigma'}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-4} \frac{1}{\mathfrak{l}} |f|_{3,\Sigma'}^\sim \\ &= \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-3} \frac{1}{\mathfrak{l}'} |f|_{3,\Sigma'}^\sim \end{aligned}$$

If $m = 0$, by Lemma XXI.3.iii and Lemma XXI.4.iii, with $\omega' = \omega - 2\alpha\mathfrak{l}'$,

$$\begin{aligned} |f_\Sigma|_{1,\Sigma,\omega}^\sim &\leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-3} \left(1 + \frac{1}{M^{j-1}\mathfrak{l}(\omega-2\alpha\mathfrak{l}')} \right) |f|_{1,\Sigma'}^\sim \\ &\leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-3} |f|_{1,\Sigma'}^\sim \end{aligned}$$

since $M^{j-1}\mathfrak{l}(\omega - 2\alpha\mathfrak{l}') \geq M^{j-1}\mathfrak{l}(\alpha\sqrt{\mathfrak{l}} - \frac{\alpha}{3}\sqrt{\mathfrak{l}}) = \frac{2}{3}\alpha M^{j-1}\mathfrak{l}^{3/2} \geq \frac{2}{3}\alpha$. Similarly one sees, using Lemma XXI.4.iv, that also in the case $m = 1$

$$|f_\Sigma|_{1,\Sigma,\omega}^\sim \leq \text{const}^n \mathfrak{c}_{j-1} \left(\frac{\mathfrak{l}'}{\mathfrak{l}}\right)^{n+m-3} |f|_{1,\Sigma'}^\sim$$

iii) Write

$$f_{\Sigma'}(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n)) = \sum_{s_1, \dots, s_n \in \Sigma} g(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n); s_1, \dots, s_n)$$

with

$$g(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n); s_1, \dots, s_n) = \int d\xi'_1 \dots d\xi'_n f(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \prod_{\ell=1}^n \hat{\chi}_{s'_\ell}(\xi'_\ell, \xi_\ell)$$

Then

$$\begin{aligned} |f_{\Sigma'}|_{p,\Sigma'}^\sim &= \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{1 \leq i_1 < \dots < i_{p-m} \leq n \\ s'_{i_1}, \dots, s'_{i_{p-m}} \in \Sigma' \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}}} \sum_{\substack{s'_i \in \Sigma' \text{ for } \\ i \neq i_1, \dots, i_{p-m}}} \\ &\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(\text{D})=\delta}} \left\| \text{D} f_\Sigma(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \\ &\leq \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{1 \leq i_1 < \dots < i_{p-m} \leq n \\ s'_{i_1}, \dots, s'_{i_{p-m}} \in \Sigma' \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}}} \sum_{\substack{s'_i \in \Sigma' \text{ for } \\ i \neq i_1, \dots, i_{p-m}}} \sum_{\substack{s_1, \dots, s_n \in \Sigma \\ s_i \cap s'_i \neq \emptyset \text{ for } 1 \leq i \leq n}} \\ &\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(\text{D})=\delta}} \left\| \text{D} g(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n); s_1, \dots, s_n) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \end{aligned}$$

For each fixed $\check{\eta}_1, \dots, \check{\eta}_m, s'_1, \dots, s'_n, s_1, \dots, s_n$,

$$\begin{aligned} & \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Dg}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n); s_1, \dots, s_n) \right\|_{1, \infty} t^\delta \\ & \leq \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Df}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1, \infty} t^\delta \prod_{\ell=1}^n \|\hat{\chi}_{s'_\ell}\|_{1, \infty} \end{aligned}$$

as in Lemma II.7 of [FKTo1]. Hence, by Lemma XII.3 of [FKTo3] and Example A.3 of [FKTo1],

$$\begin{aligned} & \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Dg}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi_1, s'_1), \dots, (\xi_n, s'_n); s_1, \dots, s_n) \right\|_{1, \infty} t^\delta \\ & \leq \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Df}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1, \infty} t^\delta \prod_{i=1}^n \text{const } \mathbf{c}_{i-1} \\ & \leq \text{const}^n \mathbf{c}_{i-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Df}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1, \infty} t^\delta \end{aligned}$$

uniformly in $s'_1, \dots, s'_n, s_1, \dots, s_n, \check{\eta}_1, \dots, \check{\eta}_m$. So

$$\begin{aligned} |f_{\Sigma'}|_{p, \Sigma'}^{\sim} & \leq \text{const}^n \mathbf{c}_{i-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{1 \leq i_1 < \dots < i_{p-m} \leq n \\ s'_{i_1}, \dots, s'_{i_{p-m}} \in \Sigma' \\ \check{\eta}_1, \dots, \check{\eta}_m \in \check{\mathcal{B}}}} \sum_{\substack{s'_i \in \Sigma' \text{ for } \\ i \neq i_1, \dots, i_{p-m}}} \sum_{\substack{s_1, \dots, s_n \in \Sigma \\ s_i \cap s'_i \neq \emptyset \text{ for } 1 \leq i \leq n}} \\ & \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Df}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1, \infty} \frac{t^\delta}{\delta!} \\ & \leq \text{const}^n \mathbf{c}_{i-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{1 \leq i_1 < \dots < i_{p-m} \leq n \\ s'_{i_1}, \dots, s'_{i_{p-m}} \in \Sigma' \\ \check{\eta}_1, \dots, \check{\eta}_m \in \check{\mathcal{B}}}} \sum_{\substack{s_i \in \Sigma \\ s_i \cap s'_i \neq \emptyset \\ \text{for } i = i_1, \dots, i_{p-m}}} \sum_{\substack{s_i \in \Sigma \text{ for } \\ i \neq i_1, \dots, i_{p-m}}} \sum_{\substack{s'_i \in \Sigma' \\ s_i \cap s'_i \neq \emptyset \\ \text{for } i \neq i_1, \dots, i_{p-m}}} \\ & \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Df}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1, \infty} \frac{t^\delta}{\delta!} \\ & \leq \text{const}^n \mathbf{c}_{i-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{1 \leq i_1 < \dots < i_{p-m} \leq n \\ s'_{i_1}, \dots, s'_{i_{p-m}} \in \Sigma' \\ \check{\eta}_1, \dots, \check{\eta}_m \in \check{\mathcal{B}}}} \sum_{\substack{s_i \in \Sigma \\ s_i \cap s'_i \neq \emptyset \\ \text{for } i = i_1, \dots, i_{p-m}}} \sum_{\substack{s_i \in \Sigma \text{ for } \\ i \neq i_1, \dots, i_{p-m}}} \\ & \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{Df}(\check{\eta}_1, \dots, \check{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1, \infty} \frac{t^\delta}{\delta!} \end{aligned}$$

since the set $\{ s'_i \in \Sigma', i \neq i_1, \dots, i_{p-m} \mid s_i \cap s'_i \neq \emptyset \text{ for } i \neq i_1, \dots, i_{p-m} \}$ contains at most 3^n terms. Finally, applying

$$\sup_{s'_{i_1}, \dots, s'_{i_{p-m}} \in \Sigma'} \sum_{\substack{s_i \in \Sigma \\ s_i \cap s'_i \neq \emptyset \\ \text{for } i = i_1, \dots, i_{p-m}}} h(s_1, \dots, s_{i_{p-m}}) \leq (\text{const} \frac{t'}{t})^{p-m} \sup_{s_{i_1}, \dots, s_{i_{p-m}} \in \Sigma} h(s_1, \dots, s_{i_{p-m}})$$

yields

$$\begin{aligned}
|f_{\Sigma'}|_{p,\Sigma'}^{\sim} &\leq \text{const}^n \left(\frac{l'}{l}\right)^{p-m} \mathfrak{c}_{i-1} \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \sup_{\substack{1 \leq i_1 < \dots < i_{p-m} \leq n \\ s_{i_1}, \dots, s_{i_{p-m}} \in \Sigma \\ \tilde{\eta}_1, \dots, \tilde{\eta}_m \in \tilde{\mathcal{B}}}} \sum_{\substack{s_i \in \Sigma \text{ for} \\ i \neq i_1, \dots, i_{p-m}}} \\
&\quad \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(\text{D})=\delta}} \left\| \text{D}f(\tilde{\eta}_1, \dots, \tilde{\eta}_m; (\xi'_1, s_1), \dots, (\xi'_n, s_n)) \right\|_{1,\infty} \frac{t^\delta}{\delta!} \\
&\leq \text{const}^n \left(\frac{l'}{l}\right)^{p-m} \mathfrak{c}_{i-1} |f|_{p,\Sigma}^{\sim}
\end{aligned}$$

■

XXII. Sector Counting for Particle–Particle Ladders

In this Section we prove that, when the Fermi surface F is strongly asymmetric in the sense of Definition XVIII.3, particle–particle ladders obey bounds that are stronger than those given by standard power counting (see Appendix D). These bounds are based on the following sector counting result.

Proposition XXII.1 *Assume that the Fermi surface F is strongly asymmetric. There is a constant const independent of M such that for all sectorizations of scale $j \geq 2$ and length $\mathfrak{l} \geq \frac{1}{M^{j-1}}$ and all $s'_1, s'_2 \in \Sigma$ and all $k_1, k_2 \in \mathbb{R} \times \mathbb{R}^2$*

$$\begin{aligned} \#\{ (s_1, s_2) \in \Sigma \times \Sigma \mid (\tilde{s}_1 + \tilde{s}_2) \cap (\tilde{s}'_1 + \tilde{s}'_2) \neq \emptyset \} &\leq \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} \\ \#\{ (s_1, s_2) \in \Sigma \times \Sigma \mid (\tilde{s}_1 + \tilde{s}_2) \cap (k_1 + \tilde{s}'_1) \neq \emptyset \} &\leq \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} \\ \#\{ (s_1, s_2) \in \Sigma \times \Sigma \mid k_1 + k_2 \in \tilde{s}_1 + \tilde{s}_2 \} &\leq \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} \end{aligned}$$

This proof of this Proposition, which is given after Lemma XXII.5, is based on the following four lemmata.

Lemma XXII.2 *Assume that F is strongly asymmetric. There exists a constant const such that for all $\varepsilon > 0$ and all disks D in $\mathbb{R}^2$ of radius ε*

$$\text{length} \{ \mathbf{k} \in F \mid \mathbf{k} + a(\mathbf{k}) \in D \} \leq \text{const} \varepsilon^{1/(n_0-1)}$$

where n_0 is the constant of Definition XVIII.3 and $a(\mathbf{k})$ is the antipode of $\mathbf{k}$.

Proof: Since F is compact, it suffices to show that each point $\mathbf{p} \in F$ has a neighbourhood U in F for which there exists $1 \leq n \leq n_0 - 1$ and a constant const such that, for all $\varepsilon > 0$ and all disks D in $\mathbb{R}^2$ of radius ε ,

$$\text{length} \{ \mathbf{k} \in U \mid \mathbf{k} + a(\mathbf{k}) \in D \} \leq \text{const} \varepsilon^{1/n}$$

Fix $\mathbf{p} \in F$. Without loss of generality, we may assume that the oriented unit tangent vector to F at $\mathbf{p}$ is $(1, 0)$ and that the unit inward pointing normal vector to F at $\mathbf{p}$ is $(0, 1)$. Let $\varphi(t) = \varphi_{\mathbf{p}}(t)$, $\bar{\varphi}(t) = \varphi_{a(\mathbf{p})}(t)$, where $\varphi_{\mathbf{p}}$ is the parameterizing map of Definition XVIII.3. Precisely, $t \mapsto \mathbf{k}(t) = \mathbf{p} + (t, \varphi(t))$ is a parameterization of F near $\mathbf{p}$ and $t \mapsto \bar{\mathbf{k}}(t) = a(\mathbf{p}) - (t, \bar{\varphi}(t))$ is a parameterization of F near $a(\mathbf{p})$.

By strict convexity, the slopes $\dot{\varphi}(t)$ and $\dot{\bar{\varphi}}(t)$ for the Fermi curve at $\mathbf{k}(t)$ and $\bar{\mathbf{k}}(t)$, respectively, are strictly increasing with t . Hence there is a strictly increasing function $\bar{t}(t)$ such that

$$\dot{\bar{\varphi}}(\bar{t}(t)) = \dot{\varphi}(t)$$

and hence

$$\bar{\mathbf{k}}(\bar{t}(t)) = a(\mathbf{k}(t))$$

so that

$$\mathbf{k}(t) + a(\mathbf{k}(t)) = \mathbf{p} + a(\mathbf{p}) + (t - \bar{t}(t), \varphi(t) - \bar{\varphi}(\bar{t}(t)))$$

Since $\ddot{\bar{\varphi}}(\bar{t})$ does not vanish, $\bar{t}(t)$ is C^{n_0-1} .

By construction, $\varphi(0) = \bar{\varphi}(0) = \dot{\varphi}(0) = \dot{\bar{\varphi}}(0) = 0$. Since F is strongly asymmetric, there is a minimal $1 \leq n \leq n_0 - 1$ such that $\bar{\varphi}^{(n+1)}(0) \neq \varphi^{(n+1)}(0)$. We may assume, without loss of generality, that

$$|\bar{\varphi}^{(n+1)}(0)| < |\varphi^{(n+1)}(0)| \quad (\text{XXII.1})$$

Denote by δ and $\bar{\delta}$ the degrees of the zeroes of $\dot{\varphi}(t)$ and $\dot{\bar{\varphi}}(t)$, respectively, at $t = 0$. By convexity, δ and $\bar{\delta}$ are odd. By (XXII.1) and the minimality of n , $\delta \leq \bar{\delta}$ and $\delta \leq n$.

We consider the cases $\delta = \bar{\delta}$ and $\delta < \bar{\delta}$ separately. First, suppose that $1 \leq \delta = \bar{\delta} \leq n$. Apply the elementary Lemma XXII.3.a, below, to $\dot{\varphi}$ and $\dot{\bar{\varphi}}$. This gives the representations

$$\dot{\varphi}(t) = t^\delta \nu(t) \quad \dot{\bar{\varphi}}(\bar{t}) = \bar{t}^\delta \bar{\nu}(\bar{t})$$

with

$$\nu(0), \bar{\nu}(0) \neq 0, \quad \nu^{(i)}(0) = \bar{\nu}^{(i)}(0) \text{ for } 0 \leq i < n - \delta, \quad \nu^{(n-\delta)}(0) \neq \bar{\nu}^{(n-\delta)}(0)$$

The δ^{th} roots $\psi(t) = (\dot{\varphi}(t))^{1/\delta}$ and $\bar{\psi}(\bar{t}) = (\dot{\bar{\varphi}}(\bar{t}))^{1/\delta}$ both have zeroes of order precisely one at 0 and obey

$$\begin{aligned} \psi(0) = \bar{\psi}(0) = 0, \quad \dot{\psi}(0), \dot{\bar{\psi}}(0) \neq 0, \quad \psi^{(i)}(0) = \bar{\psi}^{(i)}(0) \text{ for } 1 \leq i \leq n - \delta, \\ \psi^{(n-\delta+1)}(0) \neq \bar{\psi}^{(n-\delta+1)}(0) \end{aligned}$$

Since $\bar{t}(t)$ obeys

$$\bar{\psi}(\bar{t}(t)) = \psi(t)$$

we conclude that $\bar{t}(t)$ is $C^{n-\delta+1}$ and obeys

$$\bar{t}^{(i)}(0) = \begin{cases} 1 & \text{if } i = 1 \\ 0 & \text{if } 1 < i \leq n - \delta \\ \tilde{b} \neq 0 & \text{if } i = n - \delta + 1 \end{cases} \text{ if } \delta < n \quad \text{and} \quad \dot{\bar{t}}(0) = \tilde{b} \neq 1 \text{ if } \delta = n$$

Consequently, there is a neighbourhood U' of 0 and a $b > 0$ such that for all $t \in U'$

$$\left| \frac{d^{n-\delta+1}}{dt^{n-\delta+1}}(t - \bar{t}(t)) \right| \geq b \quad (\text{XXII.2})$$

Now suppose that $\delta < \bar{\delta}$. Again denoting $\psi(t) = (\dot{\varphi}(t))^{1/\delta}$ and $\bar{\psi}(\bar{t}) = (\dot{\bar{\varphi}}(\bar{t}))^{1/\delta}$, we have that $\psi(t)$ and $\bar{\psi}(\bar{t})$ are both C^1 (for $\bar{t}$ near zero, $\bar{\psi}(\bar{t}) \approx_{\text{const}} \bar{t}^{\bar{\delta}/\delta}$ and $\bar{\delta}/\delta > 1$) and obey

$$\psi(0) = \bar{\psi}(0) \quad \dot{\psi}(0) > \dot{\bar{\psi}}(0) = 0$$

As $\bar{\psi}(\bar{t}(t)) = \psi(t)$ and hence

$$\dot{\bar{t}}(t) = \frac{\dot{\psi}(t)}{\dot{\bar{\psi}}(\bar{t}(t))}$$

there is a $b > 0$ and a neighbourhood U' of 0 such that for all $t \in U' \setminus \{0\}$

$$\dot{\bar{t}}(t) \geq 1 + b \implies \left| \frac{d}{dt}(t - \bar{t}(t)) \right| \geq b \quad (\text{XXII.3})$$

Set $U = \{ \mathbf{p} + (t, \varphi(t)) \mid t \in U' \}$. If D is a disk of radius ε , then its projection to the x -axis is an interval $\mathcal{J}$ of length 2ε and

$$\text{length} \{ \mathbf{k} \in U \mid \mathbf{k} + a(\mathbf{k}) \in D \} \leq_{\text{const}} \text{length} \{ t \in U' \mid x_0 + t - \bar{t}(t) \in \mathcal{J} \}$$

where x_0 is the x -component of $\mathbf{p} + a(\mathbf{p})$. Therefore, by (XXII.2) and (XXII.3), this Lemma follows from Lemma XXII.4 below. ■

Lemma XXII.3 *Let U be a neighbourhood of 0.*

a) Let $f \in C^n(U)$ have a zero of order at least $\delta \leq n$ at 0. Then there exists a function $g \in C^{n-\delta}(U) \cap C^n(U \setminus \{0\})$ such that

$$f(t) = t^\delta g(t)$$

and

$$\lim_{\substack{t \rightarrow 0 \\ t \neq 0}} t^j g^{(n-\delta+j)}(t) = 0 \quad \text{for all } 1 \leq j \leq \delta$$

b) Let $f \in C(U) \cap C^1(U \setminus \{0\})$. If $\lim_{\substack{t \rightarrow 0 \\ t > 0}} f'(t)$ and $\lim_{\substack{t \rightarrow 0 \\ t < 0}} f'(t)$ both exist and are equal, then $f \in C^1(U)$.

Lemma XXII.4 *Let b be a strictly positive real number and n be a strictly positive integer. Let $\mathcal{I} \subset \mathbb{R}$ be an interval (not necessarily compact) and f a C^n function on $\mathcal{I}$ obeying*

$$|f^{(n)}(x)| \geq b \quad \text{for all } x \in \mathcal{I}$$

Then for all $\varepsilon > 0$ and all intervals $\mathcal{J}$ of length 2ε ,

$$\text{length} \{ x \in \mathcal{I} \mid f(x) \in \mathcal{J} \} \leq 2^{n+1} \left(\frac{\varepsilon}{b} \right)^{1/n}$$

Proof: Set $\alpha = (\frac{\varepsilon}{b})^{1/n}$ and $g(x) = f(x) - y_0$, where y_0 is the midpoint of $\mathcal{J}$. We must show

$$|g^{(n)}(x)| \geq \frac{\varepsilon}{\alpha^n} \quad \text{for all } x \in \mathcal{I} \implies \text{length}\{x \in \mathcal{I} \mid |g(x)| \leq \varepsilon\} \leq 2^{n+1}\alpha$$

Define c_n inductively by $c_1 = 2$ and $c_n = 2 + 2c_{n-1}$. Because $d_n = 2^{-n}c_n$ obeys $d_1 = 1$ and $d_n = 2^{-n+1} + d_{n-1}$ we have $d_n \leq 2$ and hence $c_n \leq 2^{n+1}$. We shall prove

$$|g^{(n)}(x)| \geq \frac{\varepsilon}{\alpha^n} \quad \text{for all } x \in \mathcal{I} \implies \text{length}\{x \in \mathcal{I} \mid |g(x)| \leq \varepsilon\} \leq c_n \alpha$$

by induction on n .

Suppose that $n = 1$ and let x and y be any two points in $\{x \in \mathcal{I} \mid |g(x)| \leq \varepsilon\}$.

Then

$$|x - y| = \frac{|x - y|}{|g(x) - g(y)|} |g(x) - g(y)| = \frac{|g(x) - g(y)|}{|g'(\zeta)|} \leq \frac{2\varepsilon}{|g'(\zeta)|}$$

for some $\zeta \in \mathcal{I}$. As $|g'(\zeta)| \geq \frac{\varepsilon}{\alpha}$ we have $|x - y| \leq 2\alpha$. Thus $\{x \in \mathcal{I} \mid |g(x)| \leq \varepsilon\}$ is contained in an interval of length at most 2α as desired.

Now suppose that $|g^{(n)}(x)| \geq \frac{\varepsilon}{\alpha^n}$ on $\mathcal{I}$ and that the induction hypothesis is satisfied for $n - 1$. As in the last paragraph, the set $\{x \in \mathcal{I} \mid |g^{(n-1)}(x)| \leq \frac{\varepsilon}{\alpha^{n-1}}\}$ is contained in a subinterval $\mathcal{I}_0$ of $\mathcal{I}$ of length at most 2α . Then $\mathcal{I} \setminus \mathcal{I}_0$ is the union of at most two other intervals $\mathcal{I}_+, \mathcal{I}_-$ on which $|g^{(n-1)}(x)| \geq \frac{\varepsilon}{\alpha^{n-1}}$. By the inductive hypothesis

$$\begin{aligned} \text{length}\{x \in \mathcal{I} \mid |g(x)| \leq \varepsilon\} &\leq \text{length}(\mathcal{I}_0) + \sum_{i=\pm} \text{length}\{x \in \mathcal{I}_i \mid |g(x)| \leq \varepsilon\} \\ &\leq 2\alpha + 2c_{n-1}\alpha = c_n\alpha \end{aligned}$$

■

Proposition XXII.5 *Assume that F is strongly asymmetric. Let Γ be an ε -separated set in F and R a square of side length 8ε in $\mathbb{R}^2$. Then*

$$\#\{(\gamma_1, \gamma_2) \in \Gamma \times \Gamma \mid \gamma_1 + \gamma_2 \in R\} \leq \text{const} \frac{\varepsilon^{1/n_0}}{\varepsilon}$$

with const depending only on the geometry of F . Here n_0 is the constant of Definition XVIII.3.

Proof: Let $\omega_1 = \varepsilon^{1-\frac{1}{n_0}}$ and

$$X_1 = \{(\gamma_1, \gamma_2) \in \Gamma \times \Gamma \mid \gamma_1 + \gamma_2 \in R, \min\{d(\gamma_1, \gamma_2), d(a(\gamma_1), \gamma_2)\} \geq \omega_1\}$$

$$X_2 = \{(\gamma_1, \gamma_2) \in \Gamma \times \Gamma \mid \gamma_1 + \gamma_2 \in R, d(\gamma_1, \gamma_2) \leq \omega_1\}$$

$$X_3 = \{(\gamma_1, \gamma_2) \in \Gamma \times \Gamma \mid \gamma_1 + \gamma_2 \in R, d(a(\gamma_1), \gamma_2) \leq \omega_1\}$$

By Lemma XX.8, part iv, with an arbitrary point $\mathbf{p}$ and ω_2 large enough,

$$\#X_1 \leq \frac{\text{const}}{\omega_1} = \text{const} \frac{\varepsilon^{1/n_0}}{\varepsilon}$$

Next observe that, for any given $\gamma_1 \in \Gamma$, the length of $\{ \gamma_1 + \mathbf{k} \mid \mathbf{k} \in F \} \cap R$ is bounded by $\text{const} \varepsilon$, so that

$$\# \{ \gamma_2 \in \Gamma \mid \gamma_1 + \gamma_2 \in R \} \leq \text{const} \quad (\text{XXII.4})$$

If, for some $\gamma_1 \in \Gamma$, there exists $\gamma_2 \in \Gamma$ such that $(\gamma_1, \gamma_2) \in X_2$, then $2\gamma_1 = \gamma_1 + \gamma_2 + (\gamma_1 - \gamma_2)$ lies in the disk D of radius $8\varepsilon + \omega_1$ centered at the center of R . Since

$$\text{length} \{ \mathbf{k} \in F \mid 2\mathbf{k} \in D \} \leq \text{const} \omega_1$$

there are at most $\text{const} \frac{\omega_1}{\varepsilon}$ choices of $\gamma_1 \in \Gamma$ with $2\gamma_1 \in D$. By (XXII.4) this implies that

$$\#X_2 \leq \text{const} \frac{\omega_1}{\varepsilon} = \text{const} \varepsilon^{-1/n_0} \leq \text{const} \frac{\varepsilon^{1/n_0}}{\varepsilon}$$

since $n_0 \geq 2$. If, for some $\gamma_1 \in \Gamma$, there exists $\gamma_2 \in \Gamma$ such that $(\gamma_1, \gamma_2) \in X_3$, then $\gamma_1 + a(\gamma_1) \in D$. By Lemma XXII.2

$$\text{length} \{ \mathbf{k} \in F \mid \mathbf{k} + a(\mathbf{k}) \in D \} \leq \text{const} \omega_1^{\frac{1}{n_0-1}}$$

Consequently

$$\#X_3 \leq \text{const} \frac{\omega_1^{\frac{1}{n_0-1}}}{\varepsilon} = \text{const} \frac{\varepsilon^{1/n_0}}{\varepsilon}$$

■

Proof of Proposition XXII.1: For each sector $s \in \Sigma_j$ let γ_s be the center of $s \cap F$. Then $\Gamma = \{\gamma_s \mid s \in \Sigma_j\}$ is a $\frac{3}{4}l_j$ separated set. Clearly $\tilde{s}'_1 + \tilde{s}'_2$ is contained in the disk of radius $\text{const}' l_j$ around $\gamma_{s'_1} + \gamma_{s'_2}$. Therefore $(\tilde{s}_1 + \tilde{s}_2) \cap (\tilde{s}'_1 + \tilde{s}'_2) \neq \emptyset$ only if $\gamma_{s_1} + \gamma_{s_2}$ is contained in the disk of radius $2\text{const}' l_j$ around $\gamma_{s'_1} + \gamma_{s'_2}$. So the first part of the Proposition follows directly from Proposition XXII.5, applied $(\frac{4\text{const}'}{8} \times \frac{4}{3})^2$ times. The other two parts are similar. ■

Definition XXII.6

i) The creation/annihilation index of $z \in \check{\mathcal{B}} \cup (\mathcal{B} \times \Sigma)$ is

$$b(z) = \begin{cases} b & \text{if } z = (k, \sigma, b) \in \check{\mathcal{B}} \\ b & \text{if } z = (x, \sigma, b, s) \in \mathcal{B} \times \Sigma \end{cases}$$

ii) Let $f \in \check{\mathcal{F}}_{4,\Sigma}$. We say that f is of particle–particle type if

$$f(z_1, z_2, z_3, z_4) = 0 \quad \text{unless } b(z_1) = b(z_2) = 0, \quad b(z_3) = b(z_4) = 1$$

Lemma XXII.7 *Let $f \in \check{\mathcal{F}}_{4;\Sigma}$ be of particle-particle type. Then,*

$$|f|_{ch,\Sigma}^{\sim} \leq \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} |f|_{3,\Sigma}^{\sim}$$

with the channel norm $|\cdot|_{ch,\Sigma}$ of Definition D.1 of [FKTo3].

Proof: It suffices to consider $f \in \check{\mathcal{F}}_r(4-r, \Sigma)$ with $r \leq 2$. As in the proof of Lemma D.2 of [FKTo3], set

$$F(\check{\eta}_1, \dots, \check{\eta}_r; s_1, \dots, s_{4-r}) = \sum_{\delta \in \mathbb{N}_0 \times \mathbb{N}_0^2} \frac{1}{\delta!} \max_{\substack{\text{D dd-operator} \\ \text{with } \delta(D)=\delta}} \left\| \text{D}f(\check{\eta}_1, \dots, \check{\eta}_r; (\xi_1, s_1), \dots, (\xi_{4-r}, s_{4-r})) \right\|_{1,\infty} t^\delta$$

Then, by Proposition XXII.1,

$$\begin{aligned} |f|_{ch,\Sigma}^{\sim} &= \sup_{\substack{\check{\eta}_1, \dots, \check{\eta}_r \in \check{\mathcal{B}} \\ s_1, \dots, s_{2-r} \in \Sigma}} \sum_{s_{3-r}, s_{4-r} \in \Sigma} F(\check{\eta}_1, \dots, \check{\eta}_r; s_1, \dots, s_{4-r}) \\ &\leq \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} \sup_{\substack{\check{\eta}_1, \dots, \check{\eta}_r \in \check{\mathcal{B}} \\ s_1, \dots, s_{3-r} \in \Sigma}} \sum_{s_{4-r} \in \Sigma} F(\check{\eta}_1, \dots, \check{\eta}_r; s_1, \dots, s_{4-r}) \\ &\leq \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} \sup_{\substack{1 \leq i_1 < \dots < i_{3-r} \leq 4-r \\ s_{i_1}, \dots, s_{i_{3-r}} \in \Sigma \\ \check{\eta}_1, \dots, \check{\eta}_r \in \check{\mathcal{B}}}} \sum_{\substack{s_i \in \Sigma \text{ for} \\ i \neq i_1, \dots, i_{3-r}}} F(\check{\eta}_1, \dots, \check{\eta}_r; s_1, \dots, s_{4-r}) = \text{const} \frac{\mathfrak{l}^{1/n_0}}{\mathfrak{l}} |f|_{3,\Sigma}^{\sim} \end{aligned}$$

■

Theorem XXII.8 *Let Σ be a sectorization of scale $j \geq 2$ and length $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$. Let $u((\xi, s), (\xi', s')), v((\xi, s), (\xi', s')) \in \mathcal{F}_0(2; \Sigma)$ be antisymmetric, spin independent, particle number conserving functions whose Fourier transforms obey $|\check{u}(k)|, |\check{v}(k)| \leq \frac{1}{2} |ik_0 - e(k)|$. Furthermore, let $X \in \mathfrak{N}_3$ and assume that $|u|_{1,\Sigma} \leq \frac{1}{2} X$ and $M^j X_0 \leq \min\{\tau_1, \tau_2\}$, where τ_1 and τ_2 are the constants of Proposition XIII.5 and Lemma XIII.6 of [FKTo3], respectively. Set*

$$C(k) = \frac{\nu^{(j)}(k)}{ik_0 - e(\mathbf{k}) - \check{u}(k)} \quad , \quad D(k) = \frac{\nu^{(\geq j+1)}(k)}{ik_0 - e(\mathbf{k}) - \check{v}(k)}$$

and let $C(\xi, \xi'), D(\xi, \xi')$ be the Fourier transforms of $C(k), D(k)$ as in Definition IX.3 of [FKTo2]. Furthermore, let $f \in \check{\mathcal{F}}_{4;\Sigma}$ be of particle-particle type. If the Fermi curve F is strongly asymmetric in the sense of Definition XVIII.3, then for all $\ell \geq 1$

$$|L_\ell(f; C, D)|_{3,\Sigma}^{\sim} \leq (\text{const} \mathfrak{l}^{1/n_0} \mathfrak{e}_j(X))^\ell |f|_{3,\Sigma}^{\sim \ell+1}$$

where $\mathfrak{e}_j(X) = \frac{\mathfrak{c}_j}{1-M^j X}$

Proof: By Proposition D.7, with X replaced by $M^j X$, and Lemma XXII.7

$$\begin{aligned} |L_\ell(f; C, D)|_{3,\Sigma}^{\sim} &\leq \left(\text{const} \frac{\mathfrak{l} \mathfrak{c}_j}{1-M^j X} \right)^\ell |f|_{ch,\Sigma}^{\sim \ell} |f|_{3,\Sigma}^{\sim} \\ &\leq (\text{const} \mathfrak{l}^{1/n_0} \mathfrak{e}_j(X))^\ell |f|_{3,\Sigma}^{\sim \ell+1} \end{aligned}$$

■

Appendix E: Sectors for k_0 Independent Functions

In [FKTf1–f3] we shall implement a renormalization algorithm that uses counterterms for the dispersion relation $e(\mathbf{k})$ that are independent of k_0 . In this appendix we adjust the discussion of sectorized norms in §XII and the discussion of resectorization, following Definition XIX.2, to deal with such functions.

Definition E.1 Let $f(\mathbf{x}, \mathbf{x}')$ be a translation invariant function on $\mathbb{R}^2 \times \mathbb{R}^2$ we define its extension $f_{\text{ext}}(\xi, \xi')$ by

$$f_{\text{ext}}((x_0, \mathbf{x}, \sigma, a), (x'_0, \mathbf{x}', \sigma', a')) = \delta_{\sigma, \sigma'} \delta(x_0 - x'_0) \begin{cases} f(\mathbf{x}, \mathbf{x}') & \text{if } a = 1, a' = 0 \\ -f(\mathbf{x}', \mathbf{x}) & \text{if } a = 0, a' = 1 \\ 0 & \text{otherwise} \end{cases}$$

and its Fourier transform as

$$\check{f}(\mathbf{k}) = \int d^2 \mathbf{x} e^{-i(\mathbf{k}_1 \mathbf{x}_1 + \mathbf{k}_2 \mathbf{x}_2)} f(\mathbf{x}, \mathbf{0})$$

Remark E.2 If $\check{f}_{\text{ext}}(k)$ is the Fourier transform of f_{ext} as in Definition IX.1.i of [FKTo2], then

$$\check{f}_{\text{ext}}((k_0, \mathbf{k})) = \check{f}(\mathbf{k})$$

Definition E.3 Let Σ be a sectorization at scale j and $K((\mathbf{x}, s), (\mathbf{x}', s'))$ a translation invariant function on $(\mathbb{R}^2 \times \Sigma)^2$.

i) We define its extension $K_{\text{ext}}((\xi, s), (\xi', s'))$ on $(\mathcal{B} \times \Sigma)^2$ by

$$K_{\text{ext}}((x_0, \mathbf{x}, \sigma, a, s), (x'_0, \mathbf{x}', \sigma', a', s')) = \delta_{\sigma, \sigma'} \delta(x_0 - x'_0) \begin{cases} K((\mathbf{x}, s), (\mathbf{x}', s')) & \text{if } a = 1, a' = 0 \\ -K((\mathbf{x}', s'), (\mathbf{x}, s)) & \text{if } a = 0, a' = 1 \\ 0 & \text{otherwise} \end{cases}$$

ii) The function $K((\mathbf{x}, s), (\mathbf{x}', s'))$ is said to be sectorized if its Fourier transform

$$\int d^2 \mathbf{x} d^2 \mathbf{x}' e^{-i(\mathbf{k}_1 \mathbf{x}_1 + \mathbf{k}_2 \mathbf{x}_2)} e^{i(\mathbf{k}'_1 \mathbf{x}'_1 + \mathbf{k}'_2 \mathbf{x}'_2)} K((\mathbf{x}, s), (\mathbf{x}', s'))$$

vanishes unless $(0, \mathbf{k}) \in \tilde{s}$ and $(0, \mathbf{k}') \in \tilde{s}'$ where $\tilde{s}$ and $\tilde{s}'$ are the extensions of s and s' of Definition XII.1.ii of [FKTo3].

iii) We define $\check{K}(\mathbf{k})$ by

$$\check{K}(\mathbf{k}) = \sum_{s, s' \in \Sigma} \int d^2 \mathbf{x} e^{-i(\mathbf{k}_1 \mathbf{x}_1 + \mathbf{k}_2 \mathbf{x}_2)} K((\mathbf{x}, s), (\mathbf{0}, s'))$$

iv) We set

$$\|K\|_{1, \Sigma} = |K_{\text{ext}}|_{1, \Sigma}$$

Remark E.4

i) If $\check{K}_{\text{ext}}(k)$ is the Fourier transform of K_{ext} as in Definition XII.4.iv, then

$$\check{K}_{\text{ext}}((k_0, \mathbf{k})) = \check{K}(\mathbf{k})$$

ii) If K is sectorized, then $K((\mathbf{x}, s), (\mathbf{x}', s'))$ and $K_{\text{ext}}((x_0, \mathbf{x}, \sigma, a, s), (x'_0, \mathbf{x}', \sigma', a', s'))$ vanish unless $s \cap s' \neq \emptyset$.

iii) Suppose that K is sectorized and write $\|K\|_{1, \Sigma} = \sum_{\delta \in \mathbb{N} \times \mathbb{N}^2} \frac{1}{\delta!} \kappa_{\delta} t^{\delta}$. Then κ_{δ} vanishes unless $\delta_0 = 0$ and otherwise is given by

$$\kappa_{0, \delta} = \max \left\{ \max_{s' \in \Sigma} \sum_{s \in \Sigma} \int d^2 \mathbf{x} |\mathbf{x}^{\delta} K((\mathbf{x}, s), (\mathbf{0}, s'))|, \max_{s \in \Sigma} \sum_{s' \in \Sigma} \int d^2 \mathbf{x} |\mathbf{x}^{\delta} K((\mathbf{x}, s), (\mathbf{0}, s'))| \right\}$$

and obeys

$$\max_{s, s' \in \Sigma} \int d^2 \mathbf{x} |\mathbf{x}^{\delta} K((\mathbf{x}, s), (\mathbf{0}, s'))| \leq \kappa_{0, \delta} \leq 3 \max_{s, s' \in \Sigma} \int d^2 \mathbf{x} |\mathbf{x}^{\delta} K((\mathbf{x}, s), (\mathbf{0}, s'))|$$

Lemma E.5 *Let Σ be a sectorization of scale $j \geq 2$ and length $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$ and $K((\mathbf{x}, s), (\mathbf{x}', s'))$ be a sectorized, translation invariant function on $(\mathbb{R}^2 \times \Sigma)^2$. Let $\mu(t)$ be a C_0^∞ function on $\mathbb{R}$ and set, for each $\Lambda > 0$*

$$\begin{aligned} \mu_{\Lambda}(k) &= \mu(\Lambda^2[k_0^2 + e(\mathbf{k})^2]) \\ (K_{\text{ext}} * \hat{\mu}_{\Lambda})((\xi, s), (\xi', s')) &= \int_{\mathcal{B}} d\zeta K_{\text{ext}}((\xi, s), (\zeta, s')) \hat{\mu}_{\Lambda}(\zeta, \xi') \\ (\hat{\mu}_{\Lambda} * K_{\text{ext}})((\xi, s), (\xi', s')) &= \int_{\mathcal{B}} d\zeta K_{\text{ext}}((\zeta, s), (\xi', s')) \hat{\mu}_{\Lambda}(\zeta, \xi) \end{aligned}$$

where $\hat{\mu}_{\Lambda}$ was defined in Definition IX.4 of [FKTo2]. Denote $j(\Lambda) = \min \{ i \in \mathbb{N} \mid M^i \geq \Lambda \}$. Then, there is a constant const , depending on μ , but not on M , j or Λ , such that

$$|K_{\text{ext}} * \hat{\mu}_{\Lambda}|_{1, \Sigma}, |\hat{\mu}_{\Lambda} * K_{\text{ext}}|_{1, \Sigma} \leq \text{const } \mathfrak{c}_{j(\Lambda)} \|K\|_{1, \Sigma}$$

This lemma is an immediate consequence of Lemma XIII.7 of [FKTo3].

Remark E.6 In the notation of Lemma E.5,

$$(K_{\text{ext}} * \hat{\mu}_\Lambda)^\sim(k) = (\hat{\mu}_\Lambda * K_{\text{ext}})^\sim(k) = \check{K}(\mathbf{k}) \mu_\Lambda(k)$$

As in Definition XIX.2, we define a resectorization for functions on $(\mathbb{R}^2 \times \Sigma)^2$. For a function $\chi(k)$ on $\mathbb{R} \times \mathbb{R}^2$, set, as in Lemma XIII.3 of [FKTo3],

$$\chi^o(\mathbf{x}) = \int e^{i\mathbf{k} \cdot \mathbf{x}} \chi(0, \mathbf{k}) \frac{d^2 \mathbf{k}}{(2\pi)^2} = \int dx_0 \hat{\chi}((x_0, \mathbf{x}, \uparrow, 0), (0, \mathbf{0}, \uparrow, 0))$$

and let

$$\hat{\chi}^o(\xi, \xi') = \delta_{\sigma, \sigma'} \delta_{a, a'} \delta(x_0 - x'_0) \chi^o((-1)^a(\mathbf{x} - \mathbf{x}'))$$

Then

$$\begin{aligned} \hat{\chi}^o((x_0, \mathbf{x}, \sigma, a), (x'_0, \mathbf{x}', \sigma', a')) &= \delta(x_0 - x'_0) \int dt \hat{\chi}((t, \mathbf{x}, \sigma, a), (0, \mathbf{x}', \sigma', a')) \\ &= \hat{\chi}((x_0, \mathbf{x}, \sigma, a), (x'_0, \mathbf{x}', \sigma', a')) \end{aligned}$$

Definition E.7 Let $j, i \geq 2$. Let Σ and Σ' be sectorizations of scale j and i , respectively. If $i \neq j$, define, for each function K on $(\mathbb{R}^2 \times \Sigma')^2$,

$$K_\Sigma((\mathbf{x}, s_1), (\mathbf{y}, s_2)) = \sum_{s'_1, s'_2 \in \Sigma} \int d\mathbf{x}' d\mathbf{y}' \chi_{s'_1}^o(\mathbf{x} - \mathbf{x}') K((\mathbf{x}', s'_1), (\mathbf{y}', s'_2)) \chi_{s'_2}^o(\mathbf{y}' - \mathbf{y})$$

where χ_s , $s \in \Sigma$ is the partition of unity of Lemma XII.3 and (XIII.2) of [FKTo3]. For $i = j$ and $\Sigma' = \Sigma$, define $K_\Sigma = K$.

Remark E.8

- i) If K is translation invariant, then $\check{K}_\Sigma(\mathbf{k}, s_1, s_2) = \sum_{s'_1, s'_2 \in \Sigma} \check{K}(\mathbf{k}, s'_1, s'_2) \chi_{s'_1}(0, \mathbf{k}) \chi_{s'_2}(0, \mathbf{k})$.
- ii) The resectorization K_Σ is sectorized.

Remark E.9 Let $K((\mathbf{x}, s), (\mathbf{x}', s'))$ be a translation invariant sectorized function on $(\mathbb{R}^2 \times \Sigma')^2$. Then

$$(K_\Sigma)_{\text{ext}}((\xi, s_1), (\eta, s_2)) = \sum_{\substack{s'_1, s'_2 \in \Sigma \\ s'_1 \cap s_1 \neq \emptyset \\ s'_2 \cap s_2 \neq \emptyset}} \int d\xi' d\eta' K_{\text{ext}}((\xi', s'_1), (\eta', s'_2)) \hat{\chi}_{s'_1}^o(\xi', \xi) \chi_{s'_2}^o(\eta', \eta)$$

Proof: Let $\xi = (x_0, \mathbf{x}, \sigma, a)$, $\eta = (y_0, \mathbf{y}, \tau, b) \in \mathcal{B}$. We consider the case $a = 1, b = 0$, the other cases are similar. Fix any $s'_1, s'_2 \in \Sigma'$. If $s'_1 \cap s_1 = \emptyset$ or $s'_2 \cap s_2 = \emptyset$.

$$\int d\xi' d\eta' K_{\text{ext}}((\xi', s'_1), (\eta', s'_2)) \hat{\chi}_{s_1}^o(\xi', \xi) \hat{\chi}_{s_2}^o(\eta', \eta) = 0 = \int d\mathbf{x}' d\mathbf{y}' \chi_{s_1}^o(\mathbf{x} - \mathbf{x}') K((\mathbf{x}', s'_1), (\mathbf{y}', s'_2)) \chi_{s_2}^o(\mathbf{y}' - \mathbf{y})$$

Otherwise

$$\begin{aligned} & \int d\xi' d\eta' K_{\text{ext}}((\xi', s'_1), (\eta', s'_2)) \hat{\chi}_{s_1}^o(\xi', \xi) \hat{\chi}_{s_2}^o(\eta', \eta) \\ &= \delta_{\sigma, \tau} \int dx'_0 dy'_0 d\mathbf{x}' d\mathbf{y}' \delta(x'_0 - y'_0) \delta(x'_0 - x_0) \delta(y'_0 - y_0) \chi_{s_1}^o(\mathbf{x} - \mathbf{x}') K((\mathbf{x}', s'_1), (\mathbf{y}', s'_2)) \chi_{s_2}^o(\mathbf{y}' - \mathbf{y}) \\ &= \delta_{\sigma, \tau} \delta(x_0 - y_0) \int d\mathbf{x}' d\mathbf{y}' \chi_{s_1}^o(\mathbf{x} - \mathbf{x}') K((\mathbf{x}', s'_1), (\mathbf{y}', s'_2)) \chi_{s_2}^o(\mathbf{y}' - \mathbf{y}) \end{aligned}$$

■

Proposition E.10 Let $j > i \geq 2$, $\frac{1}{M^{j-3/2}} \leq \mathfrak{l} \leq \frac{1}{M^{(j-1)/2}}$ and $\frac{1}{M^{i-3/2}} \leq \mathfrak{l}' \leq \frac{1}{M^{(i-1)/2}}$ with $4\mathfrak{l} < \mathfrak{l}'$. Let Σ and Σ' be sectorizations of length $\mathfrak{l}$ at scale j and length $\mathfrak{l}'$ at scale i , respectively.

i) Let $K((\mathbf{x}, s), (\mathbf{x}', s'))$ a translation invariant sectorized function on $(\mathbb{R}^2 \times \Sigma')^2$. Then

$$\|K_\Sigma\|_{1, \Sigma} \leq \text{const } \mathfrak{c}_{j-1} \|K\|_{1, \Sigma'}$$

ii) Let $K((\mathbf{x}, s), (\mathbf{x}', s'))$ a translation invariant sectorized function on $(\mathbb{R}^2 \times \Sigma)^2$. Then

$$\|K_{\Sigma'}\|_{1, \Sigma'} \leq \text{const } \left[\frac{\mathfrak{l}'}{\mathfrak{l}}\right] \mathfrak{c}_{i-1} \|K\|_{1, \Sigma}$$

Proof: i) By Definition E.3.iv, Remark E.9, Lemma II.7 of [FKTo1], Lemma XIII.3 and (XIII.4) of [FKTo3],

$$\begin{aligned} \|K_\Sigma\|_{1, \Sigma} &= \|(K_\Sigma)_{\text{ext}}\|_{1, \Sigma} \\ &\leq \text{const } \max_{s_1, s_2 \in \Sigma} \sum_{\substack{s'_1, s'_2 \in \Sigma \\ s'_1 \cap s_1 \neq \emptyset \\ s'_2 \cap s_2 \neq \emptyset}} \|K_{\text{ext}}((\cdot, s'_1), (\cdot, s'_2))\|_{1, \infty} \|\hat{\chi}_{s_1}^o\|_{1, \infty} \|\chi_{s_2}^o\|_{1, \infty} \\ &\leq \text{const } \max_{s_1, s_2 \in \Sigma} \|\chi_{s_1}^o\|_{L_1} \|\chi_{s_2}^o\|_{L_1} \max_{s'_1, s'_2 \in \Sigma'} \|K_{\text{ext}}((\cdot, s'_1), (\cdot, s'_2))\|_{1, \infty} \\ &\leq \text{const } \mathfrak{c}_{j-1}^2 \|K_{\text{ext}}\|_{1, \Sigma'} \\ &\leq \text{const } \mathfrak{c}_{j-1} \|K\|_{1, \Sigma'} \end{aligned}$$

since, for any $s \in \Sigma$, there are at most three sectors $s' \in \Sigma'$ with $s' \cap s \neq \emptyset$.

ii) Similarly

$$\begin{aligned}
\|K_{\Sigma'}\|_{1,\Sigma'} &= |(K_{\Sigma'})_{\text{ext}}|_{1,\Sigma'} \\
&\leq \text{const} \max_{s'_1, s'_2 \in \Sigma'} \sum_{\substack{s_1, s_2 \in \Sigma \\ s_1 \cap s'_1 \neq \emptyset \\ s_2 \cap s'_2 \neq \emptyset}} \|K_{\text{ext}}((\cdot, s_1), (\cdot, s_2))\|_{1,\infty} \|\hat{\chi}_{s'_1}^o\|_{1,\infty} \|\chi_{s'_2}^o\|_{1,\infty} \\
&\leq \text{const} \max_{s'_1, s'_2 \in \Sigma'} \|\chi_{s'_1}^o\|_{L_1} \|\chi_{s'_2}^o\|_{L_1} \sum_{\substack{s_1 \in \Sigma \\ s_1 \cap s'_1 \neq \emptyset}} \sum_{s_2 \in \Sigma} \|K_{\text{ext}}((\cdot, s_1), (\cdot, s_2))\|_{1,\infty} \\
&\leq \text{const} \mathfrak{c}_{i-1}^2 \left\lceil \frac{l'}{1} \right\rceil \max_{s_1 \in \Sigma} \sum_{s_2 \in \Sigma} \|K_{\text{ext}}((\cdot, s_1), (\cdot, s_2))\|_{1,\infty} \\
&\leq \text{const} \mathfrak{c}_{i-1} \left\lceil \frac{l'}{1} \right\rceil \|K\|_{1,\Sigma}
\end{aligned}$$

since, for any $s'_1 \in \Sigma'$, there are at most $\text{const} \left\lceil \frac{l'}{1} \right\rceil$ sectors $s_1 \in \Sigma$ with $s_1 \cap s'_1 \neq \emptyset$. ■

$\nu^{(j)}(k)$	j^{th} scale function	Definition VIII.1
$\tilde{\nu}^{(j)}(k)$	j^{th} extended scale function	Definition VIII.4.i
$\nu^{(\geq j)}(k)$	$\varphi(M^{2j-1}(k_0^2 + e(\mathbf{k})^2))$	Definition VIII.1
$\tilde{\nu}^{(\geq j)}(k)$	$\varphi(M^{2j-2}(k_0^2 + e(\mathbf{k})^2))$	Definition VIII.4.ii
$\bar{\nu}^{(\geq j)}(k)$	$\varphi(M^{2j-3}(k_0^2 + e(\mathbf{k})^2))$	Definition VIII.4.iii
n_0	degree of asymmetry	Definition XVIII.3
$\mathfrak{l}$	length of sectors	Definition XII.1
Σ	sectorization	Definition XII.1
$S(C)$	$\sup_m \sup_{\xi_1, \dots, \xi_m \in \mathcal{B}} \left(\left \int \psi(\xi_1) \cdots \psi(\xi_m) d\mu_C(\psi) \right \right)^{1/m}$	Definition IV.1
B	j -independent constant	Definitions XV.1, XVII.1
$\mathfrak{c}_j$	$= \sum_{\substack{ \delta \leq r \\ \delta_0 \leq r_0}} M^{j \delta } t^\delta + \sum_{\text{or } \delta > r \text{ or } \delta_0 > r_0} \infty t^\delta \in \mathfrak{N}_{d+1}$	Definition XII.2
$\mathfrak{e}_j(X)$	$= \frac{\mathfrak{c}_j}{1 - M^j X}$	Definition XV.1.ii
f_{ext}	extends $f(\mathbf{x}, \mathbf{x}')$ to $f_{\text{ext}}((x_0, \mathbf{x}, \sigma, a), (x'_0, \mathbf{x}', \sigma', a'))$	Definition E.1
$*$	convolution	before (XIII.6)
$\circ$	ladder convolution	Definition XIV.1.iv
$\bullet$	ladder convolution	Definitions XIV.3, XVI.9
$\tilde{f}$	Fourier transform	Definition IX.1.i
$\tilde{u}$	Fourier transform for sectorized u	Definition XII.4.iv
$f^\sim$	partial Fourier transform	Definition IX.1.ii
$\hat{\chi}$	Fourier transform	Definition IX.4
$\mathcal{B}$	$\mathbb{R} \times \mathbb{R}^d \times \{\uparrow, \downarrow\} \times \{0, 1\}$ viewed as position space	beginning of §II
$\check{\mathcal{B}}$	$\mathbb{R} \times \mathbb{R}^d \times \{\uparrow, \downarrow\} \times \{0, 1\}$ viewed as momentum space	beginning of §IX
$\check{\mathcal{B}}_m$	$\{ (\check{\eta}_1, \dots, \check{\eta}_m) \in \check{\mathcal{B}}^m \mid \check{\eta}_1 + \dots + \check{\eta}_m = 0 \}$	before Definition X.1
$\mathfrak{X}_\Sigma$	$\check{\mathcal{B}} \cup (\mathcal{B} \times \Sigma)$	Definition XVI.1
$\mathcal{F}_m(n)$	functions on $\mathcal{B}^m \times \mathcal{B}^n$, antisymmetric in $\mathcal{B}^m$ arguments	Definition II.9
$\check{\mathcal{F}}_m(n)$	functions on $\check{\mathcal{B}}^m \times \mathcal{B}^n$, antisymmetric in $\check{\mathcal{B}}^m$ arguments	Definition X.8
$\mathcal{F}_m(n; \Sigma)$	functions on $\mathcal{B}^m \times (\mathcal{B} \times \Sigma)^n$, internal momenta in sectors	Definition XII.4.ii
$\check{\mathcal{F}}_m(n; \Sigma)$	functions on $\check{\mathcal{B}}^m \times (\mathcal{B} \times \Sigma)^n$, internal momenta in sectors	Definition XVI.7.i
$\check{\mathcal{F}}_{n; \Sigma}$	functions on $\mathfrak{X}_\Sigma^n$ that reorder to $\check{\mathcal{F}}_m(n - m; \Sigma)$'s	Definition XVI.7.iii
